

GBDK 2020 Docs

Generated by Doxygen 1.8.17

1 General Documentation	1
1.1 Introduction	1
1.2 About the Documentation	1
1.3 About GBDK	2
1.4 Historical Info and Links	2
2 Getting Started	3
2.1 1. Compile Example projects	3
2.2 2. Use a Template	3
2.3 3. If you use GBTD / GBMB, get the fixed version	3
2.4 4. Review Coding Guidelines	3
2.5 5. Hardware and Resources	4
2.6 6. Set up C Source debugging	4
2.7 7. Try a GBDK Tutorial	4
2.8 8. Read up!	4
2.9 9. Need help?	4
3 Links and Third-Party Tools	5
3.1 SDCC Compiler Suite User Manual	5
3.2 Getting Help	5
3.3 Game Boy Documentation	5
3.4 Tutorials	5
3.5 Example code	6
3.6 Graphics Tools	6
3.7 Music drivers and tools	6
3.8 Emulators	6
3.9 Debugging tools	7
4 Using GBDK	9
4.1 Interrupts	9
4.1.1 Available Interrupts	9
4.1.2 Adding your own interrupt handler	10
4.1.3 Returning from Interrupts and STAT mode	10
4.2 What GBDK does automatically and behind the scenes	10
4.2.1 OAM (VRAM Sprite Attribute Table)	10
4.2.2 Font tiles when using stdio.h	10
4.2.3 Default Interrupt Service Handlers (ISRs)	10
4.3 Copying Functions to RAM and HIRAM	10
4.4 Mixing C and Assembly	11
4.4.1 Inline ASM within C source files	11
4.4.2 In Separate ASM files	11
4.5 Known Issues and Limitations	12
4.5.1 SDCC	12

5 Coding Guidelines	13
5.1 Learning C / C fundamentals	13
5.1.1 General C tutorials	13
5.1.2 Embedded C introductions	13
5.1.3 Game Boy games in C	13
5.2 Understanding the hardware	13
5.3 Writing optimal C code for the Game Boy and SDCC	13
5.3.1 Tools	13
5.3.1.1 GBTD / GBMB, Arrays and the "const" keyword	13
5.3.2 Variables	14
5.3.3 Code structure	14
5.3.4 GBDK API/Library	15
5.3.5 Toolchain	15
5.3.6 chars and vararg functions	15
5.4 When C isn't fast enough	16
5.4.1 Calling convention	16
5.4.2 Variables and registers	16
5.4.3 Segments	17
6 ROM/RAM Banking and MBCs	19
6.1 ROM/RAM Banking and MBCs (Memory Bank Controllers)	19
6.1.1 Unbanked cartridges	19
6.1.2 MBC Banked cartridges (Memory Bank Controllers)	19
6.2 Working with Banks	19
6.2.1 Setting the ROM bank for a Source file	19
6.2.2 Setting the RAM bank for a Source file	20
6.2.3 Setting the MBC and number of ROM & RAM banks available	20
6.2.4 Banked Functions	20
6.2.5 Const Data (Variables in ROM)	21
6.2.6 Variables in RAM	21
6.2.7 Far Pointers	21
6.2.8 Bank switching	21
6.2.9 Restoring the current bank (after calling functions which change it without restoring)	21
6.2.10 Currently active bank: <code>_current_bank</code>	21
6.3 Auto-Banking	22
6.4 Errors related to banking (overflow, multiple writes to same location)	22
6.5 Bank space usage	23
6.5.1 Other important notes	23
6.6 Banking example projects	23
7 GBDK Toolchain	25
7.1 Overview	25
7.2 Data Types	25

7.3 Changing Important Addresses	25
7.4 Compiling programs	26
7.4.1 Makefiles	27
7.5 Build Tools	27
7.5.1 lcc	27
7.5.2 sdcc	27
7.5.3 sdasgb	27
7.5.4 bankpack	27
7.5.5 slddgb	28
7.5.6 ihxcheck	28
7.5.7 makebin	28
7.6 GBDK Utilities	28
7.6.1 GBCompress	28
7.6.2 PNG to Metasprite	28
8 Example Programs	29
8.1 banks (various projects)	29
8.2 comm	29
8.3 crash	29
8.4 colorbar	29
8.5 dscan	29
8.6 filltest	29
8.7 fonts	30
8.8 galaxy	30
8.9 gb-dtmf	30
8.10 irq	30
8.11 large map	30
8.12 lcd isr wobble	30
8.13 paint	30
8.14 rand	30
8.15 ram_fn	30
8.16 rpn	30
8.17 samptest	30
8.18 sgb (various)	31
8.19 sound	31
8.20 space	31
8.21 templates	31
9 Frequently Asked Questions (FAQ)	33
9.1 Frequently Asked Questions	33
10 Migrating to new GBDK Versions	35
10.1 GBDK 2020 versions	35

10.1.1 Porting to GBDK 2020 4.0.3	35
10.1.2 Porting to GBDK 2020 4.0.2	35
10.1.3 Porting to GBDK 2020 4.0.1	35
10.1.4 Porting to GBDK 2020 4.0	35
10.1.5 Porting to GBDK 2020 3.2	36
10.1.6 Porting to GBDK 2020 3.1.1	36
10.1.7 Porting to GBDK 2020 3.1	36
10.1.8 Porting to GBDK 2020 3.0.1	36
10.2 Historical GBDK versions	36
10.2.1 GBDK 1.1 to GBDK 2.0	36
11 GBDK Releases	37
11.1 GBDK 2020 Release Notes	37
11.1.1 GBDK 2020 4.0.3	37
11.1.2 GBDK 2020 4.0.2	37
11.1.3 GBDK 2020 4.0.1	38
11.1.4 GBDK 2020 4.0	38
11.1.5 GBDK 2020 3.2	39
11.1.6 GBDK 2020 3.1.1	39
11.1.7 GBDK 2020 3.1	39
11.1.8 GBDK 2020 3.0.1	40
11.1.9 GBDK 2020 3.0	40
11.2 Historical GBDK Release Notes	40
11.2.1 GBDK 2.96	40
11.2.2 GBDK 2.95-3	41
11.2.3 GBDK 2.95-2	41
11.2.4 GBDK 2.95	41
11.2.5 GBDK 2.94	42
11.2.6 GBDK 2.93	42
11.2.7 GBDK 2.92-2 for win32	43
11.2.8 GBDK 2.92	43
11.2.9 GBDK 2.91	43
11.2.10 GBDK 2.1.5	44
12 Todo List	45
13 Module Index	47
13.1 C modules	47
14 Data Structure Index	49
14.1 Data Structures	49
15 File Index	51
15.1 File List	51

16 Module Documentation	53
16.1 List of gbdk fonts	53
16.1.1 Description	53
16.1.2 Variable Documentation	53
16.1.2.1 font_spect	53
16.1.2.2 font_italic	53
16.1.2.3 font_ibm	53
16.1.2.4 font_min	53
16.1.2.5 font_ibm_fixed	53
17 Data Structure Documentation	55
17.1 __far_ptr Union Reference	55
17.1.1 Detailed Description	55
17.1.2 Field Documentation	55
17.1.2.1 ptr	55
17.1.2.2 ofs	55
17.1.2.3 seg	55
17.1.2.4 segofs	56
17.1.2.5 fn	56
17.1.2.6 segfn	56
17.2 __fixed Union Reference	56
17.2.1 Detailed Description	56
17.2.2 Field Documentation	56
17.2.2.1 l	56
17.2.2.2 h	56
17.2.2.3 b	56
17.2.2.4 w	56
17.3 atomic_flag Struct Reference	57
17.3.1 Field Documentation	57
17.3.1.1 flag	57
17.4 joypads_t Struct Reference	57
17.4.1 Detailed Description	57
17.4.2 Field Documentation	57
17.4.2.1 npads	57
17.4.2.2 joy0	57
17.4.2.3 joy1	58
17.4.2.4 joy2	58
17.4.2.5 joy3	58
17.4.2.6 joypads	58
17.4.2.7 "@4	58
17.5 metasprite_t Struct Reference	58
17.5.1 Detailed Description	58

17.5.2 Field Documentation	58
17.5.2.1 dy	58
17.5.2.2 dx	58
17.5.2.3 dtile	58
17.5.2.4 props	59
17.6 OAM_item_t Struct Reference	59
17.6.1 Detailed Description	59
17.6.2 Field Documentation	59
17.6.2.1 y	59
17.6.2.2 x	59
17.6.2.3 tile	59
17.6.2.4 prop	59
17.7 sfont_handle Struct Reference	60
17.7.1 Detailed Description	60
17.7.2 Field Documentation	60
17.7.2.1 first_tile	60
17.7.2.2 font	60
17.8 smalloc_hunk Struct Reference	60
17.8.1 Field Documentation	60
17.8.1.1 magic	60
17.8.1.2 next	60
17.8.1.3 size	60
17.8.1.4 status	61

- [Migrating to new GBDK Versions](#)
- [GBDK Releases](#)

1.1 Introduction

Welcome to GBDK-2020! The best thing to do is head over to the [Getting Started](#) section to get up and running.

1.2 About the Documentation

This documentation is partially based on material written by the original GBDK authors in 1999 and updated for GBDK-2020. The API docs are automatically generated from the C header files using Doxygen.

GBDK-2020 is an updated version of the original GBDK with a modernized SDCC toolchain and many API improvements and fixes. It can be found at: <https://github.com/Zal0/gbdk-2020/>.

The original GBDK sources, documentation and website are at: <http://gbdk.sourceforge.net/>

1.3 About GBDK

The GameBoy Developer's Kit (GBDK, GBDK-2020) is used to develop games and programs for the Nintendo Game Boy system in C and assembly. GBDK includes a set of libraries for the most common requirements and generates image files for use with a real GameBoy or with emulators.

GBDK features:

- C and ASM toolchain based on SDCC with some support utilities
- A set of libraries with source code
- Example programs in ASM and in C
- Support for multiple ROM bank images

GBDK is freeware. Most of the tooling code is under the GPL. The runtime libraries should be under the LGPL. Please consider mentioning GBDK in the credits of projects made with it.

1.4 Historical Info and Links

The following is from the original GBDK documentation.

Thanks to quang for many of the comments to the gb functions. Some of the comments are ripped directly from the Linux Programmers manual, and some directly from the pan/k00Pa document.

quangDX.com

[The \(original\) gbdk homepage](#)

[Jeff Frohwein's GB development page](#). A extensive source of Game Boy related information, including GeeBee's GB faq and the pan/k00Pa document.

Chapter 2

Getting Started

Follow the steps in this section to start using GBDK-2020.

2.1 1. Compile Example projects

Make sure your GBDK-2020 installation is working correctly by compiling some of the included [example projects](#). Navigate to the example projects folder ("`examples/gb/`" under your GBDK-2020 install folder) and open a command line. Then type:

```
make
```

This should build all of the examples sequentially. You can also navigate into an individual example project's folder and build it by typing `make`.

If everything works and there are no errors reported each example sub-folder should have it's on `.gb` ROM file.

2.2 2. Use a Template

To create a new project use a template!

There are template projects included in the [GBDK example projects](#) to help you get up and running. Their folder names start with `template_`.

1. Copy one of the template folders to a new folder name
2. If you moved the folder out of the GBDK examples then you **must** update the GBDK path variable and/or the path to LCC in the `Makefile` or `make.bat` so that it will still build correctly.
3. Type `make` on the command line in that folder to verify it still builds.
4. Open `main.c` to start making changes.

2.3 3. If you use GBTD / GBMB, get the fixed version

If you plan to use GBTD / GBMB for making graphics, make sure to get the version with the `const` fix and other improvements. See [const_gbtd_gbmb](#).

2.4 4. Review Coding Guidelines

Take a look at the [coding guidelines](#), even if you have experience writing software for other platforms. There is important information to help you get good results and performance on the Game Boy.

If you haven't written programs in C before, check the [C tutorials section](#).

2.5 5. Hardware and Resources

If you have a specific project in mind, consider what hardware you want to target. It isn't something that has to be decided up front, but it can influence design and implementation.

What size will your game or program be?

- 32K Cart (no-MBC required)
- Larger than 32K (MBC required)
- See more details about [ROM Banking and MBCs](#).

What hardware will it run on?

- Game Boy (& Game Boy Color)
- Game Boy Color only
- Game Boy & Super Game Boy
- See how to [set the compatibility type in the cartridge header](#). Read more about hardware differences in the [Pandocs](#)

2.6 6. Set up C Source debugging

Tracking down problems in code is easier with a debugger. Emulicious has a [debug adapter](#) that provides C source debugging with GBDK-2020.

2.7 7. Try a GBDK Tutorial

You might want to start off with a guided GBDK tutorial from the [GBDK Tutorials section](#).

- **Note:** Tutorials (or parts of them) may be based on the older GBDK from the 2000's before it was updated to be GBDK-2020. The general principals are all the same, but the setup and parts of the [toolchain](#) (compiler/etc) may be somewhat different and some links may be outdated (pointing to the old GBDK or old tools).

2.8 8. Read up!

- It is strongly encouraged to read more [GBDK-2020 General Documentation](#).
- Learn about the Game Boy hardware by reading through the [Pandocs](#) technical reference.

2.9 9. Need help?

Check out the links for [online community and support](#) and read the [FAQ](#).

Chapter 3

Links and Third-Party Tools

This is a brief list of useful tools and information. It is not meant to be complete or exhaustive, for a larger list see [awesome_gb](#)

3.1 SDCC Compiler Suite User Manual

- GBDK-2020 uses the SDCC compiler and related tools. The SDCC manual goes into much more detail about available features and how to use them.

<http://sdcc.sourceforge.net/doc/sdccman.pdf>

<http://sdcc.sourceforge.net>

3.2 Getting Help

- GBDK Discord community:

<https://github.com/Zal0/gbdk-2020/#discord-servers>

- Game Boy discussion forum:

<https://gbdev.gg8.se/forums/>

3.3 Game Boy Documentation

- **Pandocs**

Extensive and up-to-date technical documentation about the Game Boy and related hardware.

<https://gbdev.io/pandocs/>

- **Awesome Game Boy List**

A list of Game Boy/Color development resources, tools, docs, related projects and homebrew.

<https://gbdev.io/list.html>

3.4 Tutorials

- **Gaming Monsters Tutorials**

Several video tutorials and code for making games with GBDK/GBDK-2020.

<https://www.youtube.com/playlist?list=PLeEj4c2zF7PaFv5MPYhNAkBGkx4iPGJo>

<https://github.com/gingemonster/GamingMonstersGameBoySampleCode>

3.5 Example code

- **Simplified GBDK examples**

https://github.com/mrombout/gbdk_playground/commits/master

3.6 Graphics Tools

- **Game Boy Tile Designer and Map Builder (GBTD / GBMB)**

Sprite / Tile editor and Map Builder that can export to C that works with GBDK.

- **Use this updated version:** (has const export fixed and other improvements):

https://github.com/untoxa/GBTD_GBMB

- This older version is **not recommended**:

<http://www.devr.com/gb/hmgd/intro.html> (old, original tools)

- A GIMP plugin for import/export:

<https://github.com/bbbbr/gimp-tilemap-gb> (GIMP plugin to read/write GBR/GBM files)

- **Tilemap Studio**

A tilemap editor for Game Boy, GBC, GBA, or SNES projects.

<https://github.com/Rangi42/tilemap-studio/>

3.7 Music drivers and tools

- **GBT Player**

A .mod converter and music driver that works with GBDK and RGBDS.

<https://github.com/AntonioND/gbt-player>

Docs from GBStudio that should mostly apply: <https://www.gbstudio.dev/docs/music/>

- **hUGEdriver**

A tracker and music driver that works with GBDK and RGBDS. It is smaller, more efficient and more versatile than gbt_player.

<https://github.com/untoxa/hUGEBuild>

<https://github.com/SuperDisk/hUGEDriver>

<https://github.com/SuperDisk/hUGETracker>

3.8 Emulators

- **BGB**

Accurate emulator, has useful debugging tools.

<http://bgb.bircd.org/>

- **Emulicious**

An accurate emulator with extensive tools including source level debugging.

<https://emulicious.net/>

3.9 Debugging tools

- **Emulicious debug adapter**

Provides source-level debugging in VS Code that works with GBDK2020.

<https://marketplace.visualstudio.com/items?itemName=emulicious.emulicious-debugger>

- **romusage**

Calculate used and free space in banks (ROM/RAM) and warn about errors such as bank overflows.

<https://github.com/bbbbr/romusage>

- **noi2sym.py**

Convert .noi files into a symbol format compatible with BGB. Allows BGB to recognize variables and functions based on address.

<https://github.com/untoxa/hUGEBuild/blob/master/tools/noi2sym.py>

- **src2sym.pl**

Add line-by-line C source code to the main symbol file in a BGB compatible format. This allows for C source-like debugging in BGB in a limited way.

<https://gbdev.gg8.se/forums/viewtopic.php?id=710>

Chapter 4

Using GBDK

4.1 Interrupts

Interrupts allow execution to jump to a different part of your code as soon as an external event occurs - for example the LCD entering the vertical blank period, serial data arriving or the timer reaching its end count. For an example see the `irq.c` sample project.

Interrupts in GBDK are handled using the functions [disable_interrupts\(\)](#), [enable_interrupts\(\)](#), [set_interrupts\(UBYTE ier\)](#) and the interrupt service routine (ISR) linkers [add_VBL\(\)](#), [add_TIM](#), [add_LCD](#), [add_SIO](#) and [add_JOY](#) which add interrupt handlers for the vertical blank, timer, LCD, serial link and joypad interrupts respectively.

Since an interrupt can occur at any time an Interrupt Service Request (ISR) cannot take any arguments or return anything. Its only way of communicating with the greater program is through the global variables. When interacting with those shared ISR global variables from main code outside the interrupt, it is a good idea to wrap them in a `critical {}` section in case the interrupt occurs and modifies the variable while it is being used.

Interrupts should be disabled before adding ISRs. To use multiple interrupts, *logical OR* the relevant IFLAGS together.

ISRs should be kept as small and short as possible, do not write an ISR so long that the Game Boy hardware spends all of its time servicing interrupts and has no time spare for the main code.

For more detail on the Game Boy interrupts consider reading about them in the [Pandocs](#).

4.1.1 Available Interrupts

The GameBoy hardware can generate 5 types of interrupts. Custom Interrupt Service Routines (ISRs) can be added in addition to the built-in ones available in GBDK.

- VBL : LCD Vertical Blanking period start
 - The default VBL ISR is installed automatically.
 - * See [add_VBL\(\)](#) and [remove_VBL\(\)](#)
- LCD : LCDC status (such as the start of a horizontal line)
 - See [add_LCD\(\)](#) and [remove_LCD\(\)](#)
 - Example project: `lcd_isr_wobble`
- TIM : Timer overflow
 - See [add_TIM\(\)](#) and [remove_TIM\(\)](#)
 - Example project: `tim`
- SIO : Serial Link I/O transfer end
 - The default SIO ISR gets installed automatically if any of the standard SIO calls are used. These calls include [add_SIO\(\)](#), [remove_SIO\(\)](#), [send_byte\(\)](#), [receive_byte\(\)](#).
 - The default SIO ISR cannot be removed once installed. Only secondary chained SIO ISRs (added with [add_SIO\(\)](#)) can be removed.
 - See [add_SIO\(\)](#) and [remove_SIO\(\)](#)

- Example project: `comm`
- JOY : Transition from high to low of a joystick button
 - See [add_JOY\(\)](#) and [remove_JOY\(\)](#)

4.1.2 Adding your own interrupt handler

It is possible to install your own interrupt handlers (in C or in assembly) for any of these interrupts. Up to 4 chained handlers may be added, with the last added being called last. If the [remove_VBL\(\)](#) function is to be called, only three may be added for VBL.

Interrupt handlers are called in sequence. To install a new interrupt handler, do the following:

1. Write a function (say `foo()`) that takes no parameters, and that returns nothing. Remember that the code executed in an interrupt handler must be short.
2. Inside a `__critical { ... }` section, install your interrupt handling routines using the `add_XXX()` function, where XXX is the interrupt that you want to handle.
3. Enable interrupts for the IRQ you want to handle, using the [set_interrupts\(\)](#) function. Note that the VBL interrupt is already enabled before the `main()` function is called. If you want to set the interrupts before `main()` is called, you must install an initialization routine.

See the `irq` example project for additional details for a complete example.

4.1.3 Returning from Interrupts and STAT mode

By default when an Interrupt handler completes and is ready to exit it will check `STAT_REG` and only return at the BEGINNING of either LCD Mode 0 or Mode 1. This helps prevent graphical glitches caused when an ISR interrupts a graphics operation in one mode but returns in a different mode for which that graphics operation is not allowed. You can change this behavior using [nowait_int_handler\(\)](#) which does not check `STAT_REG` before returning. Also see [wait_int_handler\(\)](#).

4.2 What GBDK does automatically and behind the scenes

4.2.1 OAM (VRAM Sprite Attribute Table)

GBDK sets up a Shadow OAM which gets copied automatically to the hardware OAM by the default V-Blank ISR. The Shadow OAM allows updating sprites without worrying about whether it is safe to write to them or not based on the hardware LCD mode.

4.2.2 Font tiles when using `stdio.h`

Including [stdio.h](#) and using functions such as [printf\(\)](#) will use a large number of the background tiles for font characters. If `stdio.h` is not included then that space will be available for use with other tiles instead.

4.2.3 Default Interrupt Service Handlers (ISRs)

- V-Blank: A default V-Blank ISR is installed on startup which copies the Shadow OAM to the hardware OAM and increments the global [sys_time](#) variable once per frame.
- Serial Link I/O: If any of the GBDK serial link functions are used such as [send_byte\(\)](#) and [receive_byte\(\)](#), the default SIO serial link handler will be installed automatically at compile-time.

4.3 Copying Functions to RAM and HIRAM

The `ram_function` example project included with GBDK demonstrates copying functions to RAM and HIRAM. It is possible to copy functions to RAM and HIRAM (using the [memcpy\(\)](#) and [hramcpy\(\)](#) functions), and execute them from C. The compiler automatically generates two symbols for the start and the end of each function, named

start_X and end_X (where X is the name of the function). This enables to calculate the length of a function when copying it to RAM. Ensure you have enough free space in RAM or HIRAM for copying a function. There are basically two ways for calling a function located in RAM, HIRAM, or ROM:

- Declare a pointer-to-function variable, and set it to the address of the function to call.
- Declare the function as extern, and set its address at link time using the -Wl-gXXX=# flag (where XXX is the name of the function, and # is its address).

The second approach is slightly more efficient. Both approaches are demonstrated in the `ram_function.c` example.

4.4 Mixing C and Assembly

You can mix C and assembly (ASM) in two ways as described below. For additional detail see the [links_sdcc_docs](#).

4.4.1 Inline ASM within C source files

Example:

```
__asm__("nop");
```

Another Example:

```
void some_c_function()
{
    // Optionally do something
    __asm
        (ASM code goes here)
    __endasm;
}
```

4.4.2 In Separate ASM files

Todo This is from GBDK 2.x docs, verify it with GBDK-2020 and modern SDCC

It is possible to assemble and link files written in ASM alongside files written in C.

- A C identifier `i` will be called `_i` in assembly.
- Results are always returned into the `DE` register.
- Parameters are passed on the stack (starting at `SP+2` because the return address is also saved on the stack).
- Assembly identifier are exported using the `.globl` directive.
- You can access GameBoy hardware registers using `_reg_0xXX` where `XX` is the register number (see `sound.c` for an example).
- Registers must be preserved across function calls (you must store them at function begin, and restore them at the end), except `HL` (and `DE` when the function returns a result).

Here is an example of how to mix assembly with C:

`main.c`

```
main()
{
    WORD i;
    WORD add(WORD, WORD);

    i = add(1, 3);
}
```

`add.s`

```

.globl _add
_add:      ; WORD add(WORD a, WORD b)
           ; There is no register to save:
           ; BC is not used
           ; DE is the return register
           ; HL needs never to be saved

LDA HL, 2(SP)
LD E, (HL) ; Get a in DE
INC HL
LD D, (HL)
INC HL
LD A, (HL) ; Get b in HL
INC HL
LD H, (HL)
LD L, A
ADD HL, DE ; Add DE to HL
LD D, H
LD E, L
           ; There is no register to restore
RET        ; Return result in DE

```

4.5 Known Issues and Limitations

4.5.1 SDCC

- Const arrays declared with `somevar[n] = {x}` will **NOT** get initialized with value `x`. This may change when the SDCC RLE initializer is fixed. Use `memset` for now if you need it.
- SDCC banked calls and [far_pointers](#) in GBDK only save one byte for the ROM bank, so for example they are limited to **bank 15** max for MBC1 and **bank 255** max for MBC5. See [banked_calls](#) for more details.

Chapter 5

Coding Guidelines

5.1 Learning C / C fundamentals

Writing games and other programs with GBDK will be much easier with a basic understanding of the C language. In particular, understanding how to use C on "Embedded Platforms" (small computing systems, such as the Game Boy) can help you write better code (smaller, faster, less error prone) and avoid common pitfalls.

5.1.1 General C tutorials

- <https://www.learn-c.org/>
- <https://www.tutorialspoint.com/cprogramming/index.htm>

5.1.2 Embedded C introductions

- <http://dsp-book.narod.ru/CPES.pdf>
- <https://www.phaedsys.com/principals/bytecraft/bytecraftdata/bcfirststeps.pdf>

5.1.3 Game Boy games in C

- <https://gbdev.io/list.html#c>

5.2 Understanding the hardware

In addition to understanding the C language it's important to learn how the Game Boy hardware works. What it is capable of doing, what it isn't able to do, and what resources are available to work with. A good way to do this is by reading the [Pandocs](#) and checking out the [awesome_gb](#) list.

5.3 Writing optimal C code for the Game Boy and SDCC

The following guidelines can result in better code for the Game Boy, even though some of the guidance may be contrary to typical advice for general purpose computers that have more resources and speed.

5.3.1 Tools

5.3.1.1 GBTD / GBMB, Arrays and the "const" keyword

Important: The old [GBTD/GBMB](#) fails to include the `const` keyword when exporting to C source files for GBDK. That causes arrays to be created in RAM instead of ROM, which wastes RAM, uses a lot of ROM to initialize the RAM arrays and slows the compiler down a lot.

__Use of [toxa's updated GBTD/GBMB](#) is highly recommended.__

If you wish to use the original tools, you must add the `const` keyword every time the graphics are re-exported to C source files.

5.3.2 Variables

- Use 8-bit values as much as possible. They will be much more efficient and compact than 16 and 32 bit types.
- Prefer unsigned variables to signed ones: The code generated will be generally more efficient, especially when comparing two values.
- Use explicit types so you always know the size of your variables. `INT8`, `UINT8`, `INT16`, `UINT16`, `INT32`, `UINT32` or `BYTE`, `UBYTE`, `WORD`, `UWORD`, `LWORD`, `ULWORD`. Types are defined in [asm/types.h](#) and [asm/gbz80/types.h](#)
- Global and local static variables are generally more efficient than local non-static variables (which go on the stack and are slower and can result in slower code).
- `const` keyword: Use `const` for arrays, structs and variables with read-only (constant) data. It will reduce ROM, RAM and CPU usage significantly. Non-`const` values are loaded from ROM into RAM inefficiently, and there is no benefit in loading them into the limited available RAM if they aren't going to be changed.
- For calculated values that don't change, pre-compute results once and store the result. Using lookup-tables and the like can improve speed and reduce code size. Macros can sometimes help. It may be beneficial to do the calculations with an outside tool and then include the result as C code in a `const` array.
- Use an advancing pointer (`someStruct->var = x; someStruct++`) to loop through arrays of structs instead of using indexing each time in the loop `someStruct[i].var = x`.
- When modifying variables that are also changed in an Interrupt Service Routine (ISR), wrap them the relevant code block in a `__critical { }` block. See <http://sdcc.sourceforge.net/doc/sdccman.pdf#section.3.9>
- When using constants and literals the `U`, `L` and `UL` postfixes can be used.
 - `U` specifies that the constant is unsigned
 - `L` specifies that the constant is long.
 - NOTE: In SDCC 3.6.0, the default for `char` changed from signed to unsigned. The manual says to use `--fsigned-char` for the old behavior, this option flag is included by default when compiling through `lcc`.

5.3.3 Code structure

- When processing for a given frame is done and it is time to wait before starting the next frame, [wait_vbl_done\(\)](#) can be used. It uses `HALT` to put the CPU into a low power state until processing resumes. The CPU will wake up and resume processing at the end of the current frame when the Vertical Blanking interrupt is triggered.
- Minimize use of multiplication, modulo and division. These operations have no corresponding CPU instructions (software functions), and hence are time costly. Division by powers of 2 are better, they have specific SDCC optimizations.
 - Alternatives to modulo:
 - * When using power of 2 you can use bit masks. Example: `(n % 8)` can be achieved with `(n & 0x7)`
 - * If you need decimal numbers to count or display a score, you can use the GBDK BCD ([binary coded decimal](#)) number functions. See: [bcd.h](#) and the BCD example project included with GBDK.
- Avoid long lists of function parameters. Passing many parameters can add overhead, especially if the function is called often. When applicable globals and local static vars can be used instead.
- Use inline functions if the function is short. (with the `inline` keyword, such as `inline UINT8 myFunction() { ... }`)

- Do not use recursive functions
- Prefer `==` and `!=` comparison operators to `<`, `<=`, `>`, and `>=`. The code will be shorter and quicker.

It is even faster to check if a variable is 0 than if it is equal to some other value, so looping from *N down to zero* is faster than looping *from zero up to N*.

For instance:

```
for(i = 0; i < 10; i++)
```

is less efficient than:

```
for(i = 0; i != 10; i++)
```

and if possible, even better:

```
for(i = 10; i != 0; i--)
```

5.3.4 GBDK API/Library

- `stdio.h`: If you have other ways of printing text, avoid including `stdio.h` and using functions such as `printf()`. Including it will use a large number of the background tiles for font characters. If `stdio.h` is not included then that space will be available for use with other tiles instead.
- `drawing.h`: The Game Boy graphics hardware is not well suited to frame-buffer style graphics such as the kind provided in `drawing.h`. Due to that, most drawing functions (rectangles, circles, etc) will be slow. When possible it's much faster and more efficient to work with the tiles and tile maps that the Game Boy hardware is built around.
- `waitpad()` and `waitpadup` check for input in a loop that doesn't HALT at all, so the CPU will be maxed out until it returns. One alternative is to write a function with a loop that checks input with `joypad()` and then waits a frame using `wait_vbl_done()` (which idles the CPU while waiting) before checking input again.

5.3.5 Toolchain

- See SDCC optimizations: <http://sdcc.sourceforge.net/doc/sdccman.pdf#section.8.1>
- Use profiling. Look at the ASM generated by the compiler, write several versions of a function, compare them and choose the faster one.
- Use the SDCC `--max-allocs-per-node` flag with large values, such as 50000. `--opt-code-speed` has a much smaller effect.
 - GBDK-2020 (after v4.0.1) compiles the library with `--max-allocs-per-node 50000`, but it must be turned on for your own code.
(example: `lcc ... -Wf--max-allocs-per-mode 50000` or `sdcc ... --max-allocs-per-mode 50000`).
 - The other code/speed flags are `--opt-code-speed` or `--opt-code-size`.
- Use current SDCC builds from <http://sdcc.sourceforge.net/snap.php>
The minimum required version of SDCC will depend on the GBDK-2020 release. See [GBDK Releases](#)
- Learn some ASM and inspect the compiler output to understand what the compiler is doing and how your code gets translated. This can help with writing better C code and with debugging.

5.3.6 chars and vararg functions

In standard C when `chars` are passed to a function with variadic arguments (varargs, those declared with `...` as a parameter), such as `printf()`, those `chars` get automatically promoted to `ints`. For an 8 bit cpu such as the Game Boy's, this is not as efficient or desirable in most cases. So the default SDCC behavior, which GBDK-2020 expects, is that chars will remain chars and *not* get promoted to ints when **explicitly cast as chars while calling a varargs function**.

- They must be explicitly re-cast when passing them to a varargs function, even though they are already declared as chars.
- Discussion in SDCC manual:
 - <http://sdcc.sourceforge.net/doc/sdccman.pdf#section.1.5>
 - <http://sdcc.sourceforge.net/doc/sdccman.pdf#subsection.3.5.10>
- If SDCC is invoked with `-std-cxx` (`-std-c89`, `-std-c99`, `-std-c11`, etc) then it will conform to standard C behavior and calling functions such as `printf()` with chars may not work as expected.

For example:

```
unsigned char i = 0x5A;

// NO:
// The char will get promoted to an int, producing incorrect printf output
// The output will be: 5A 00
printf("%hx %hx", i, i);

// YES:
// The char will remain a char and printf output will be as expected
// The output will be: 5A 5A
printf("%hx %hx", (unsigned char)i, (unsigned char)i);
```

Some functions that accept varargs:

- `BGB_MESSAGE_FMT`, `gprintf()`, `printf()`, `sprintf()`

Also See:

- Other cases of char to int promotion: <http://sdcc.sourceforge.net/doc/sdccman.pdf#chapter.6>

5.4 When C isn't fast enough

Todo Update and verify this section for the modernized SDCC and toolchain

For many applications C is fast enough but in intensive functions are sometimes better written in assembler. This section deals with interfacing your core C program with fast assembly sub routines.

5.4.1 Calling convention

sdcc in common with almost all C compilers prepends a '_' to any function names. For example the function `printf(...)` begins at the label `_printf::`. Note that all functions are declared global.

The parameters to a function are pushed in right to left order with no aligning - so a byte takes up a byte on the stack instead of the more natural word. So for example the function `int store_byte(UWORD addr, UBYTE byte)` would push 'byte' onto the stack first then `addr` using a total of three bytes. As the return address is also pushed, the stack would contain:

```
At SP+0 - the return address

At SP+2 - addr

At SP+4 - byte
```

Note that the arguments that are pushed first are highest in the stack due to how the Game Boy's stack grows downwards.

The function returns in DE.

5.4.2 Variables and registers

C normally expects registers to be preserved across a function call. However in the case above as DE is used as the return value and HL is used for anything, only BC needs to be preserved.

Getting at C variables is slightly tricky due to how local variables are allocated on the stack. However you shouldn't be using the local variables of a calling function in any case. Global variables can be accessed by name by adding an underscore.

5.4.3 Segments

The use of segments for code, data and variables is more noticeable in assembler. GBDK and SDCC define a number of default segments - `_CODE`, `_DATA` and `_BSS`. Two extra segments `_HEADER` and `_HEAP` exist for the Game Boy header and malloc heap respectively.

The order these segments are linked together is determined by `crt0.s` and is currently `_CODE` in ROM, then `_DATA`, `_BSS`, `_HEAP` in WRAM, with `STACK` at the top of WRAM. `_HEAP` is placed after `_BSS` so that all spare memory is available for the malloc routines. To place code in other than the first two banks, use the segments `_CODE_x` where x is the 16kB bank number.

As the `_BSS` segment occurs outside the ROM area you can only use `.ds` to reserve space in it.

While you don't have to use the `_CODE` and `_DATA` distinctions in assembler you may wish to do so consistency.

Chapter 6

ROM/RAM Banking and MBCs

6.1 ROM/RAM Banking and MBCs (Memory Bank Controllers)

The standard Game Boy cartridge with no MBC has a fixed 32K bytes of ROM. In order to make cartridges with larger ROM sizes (to store more code and graphics) MBCs can be used. They allow switching between multiple ROM banks that use the same memory region. Only one of the banks can be selected as active at a given time, while all the other banks are inactive (and so, inaccessible).

6.1.1 Unbanked cartridges

Cartridges with no MBC controller are unbanked, they have 32K bytes of fixed ROM space and no switchable banks. For these cartridges the ROM space between 0000h and 7FFFh can be treated as a single large bank of 32K bytes, or as two contiguous banks of 16K bytes in Bank 0 at 0000h – 3FFFh and Bank 1 at 4000h to 7FFFh.

6.1.2 MBC Banked cartridges (Memory Bank Controllers)

Cartridges with MBCs allow the the Game Boy to work with ROMs up to 8MB in size and with RAM up to 128kB. Each bank is 16K Bytes.

- Bank 0 of the ROM is located in the region at 0000h – 3FFFh. It is *usually* fixed (unbanked) and cannot be switched out for another bank.
- The higher region at 4000h to 7FFFh is used for switching between different ROM banks.

See the [Pandocs](#) for more details about the individual MBCs and their capabilities.

6.2 Working with Banks

To assign code and constant data (such as graphics) to a ROM bank and use it:

- Place the code for your ROM bank in one or several source files.
- Specify the ROM bank to use, either in the source file or at compile/link time.
- Specify the number of banks and MBC type during link time.
- When the program is running and wants to use data or call a function that is in a given bank, manually or automatically set the desired bank to active.

6.2.1 Setting the ROM bank for a Source file

The ROM and RAM bank for a source file can be set in a couple different ways. Multiple different banks cannot be assigned inside the same source file (unless the `__addressmod` method is used), but multiple source files can share the same bank.

If no ROM and RAM bank are specified for a file then the default `_CODE`, `_BSS` and `_DATA` segments are used.

Ways to set the ROM bank for a Source file

- `#pragma bank <N>` at the start of a source file. Example (ROM bank 2): `#pragma bank 2`
- The lcc switch for ROM bank `-Wf-bo<N>`. Example (ROM bank 2): `-Wf-bo2`
- Using [rom_autobanking](#)

Note: You can use the `UNBANKED` keyword to define a function as unbanked if it resides in a source file which has been assigned a bank.

6.2.2 Setting the RAM bank for a Source file

- Using the lcc switch for RAM bank `-Wf-ba<N>`. Example (RAM bank 3): `-Wf-bo3`

6.2.3 Setting the MBC and number of ROM & RAM banks available

At the link stage this is done with `lcc` using pass-through switches for [makebin](#).

- `-Wl-yo<N>` where `<N>` is the number of ROM banks. 2, 4, 8, 16, 32, 64, 128, 256, 512
- `-Wl-ya<N>` where `<N>` is the number of RAM banks. 2, 4, 8, 16, 32
- `-Wl-yt<N>` where `<N>` is the type of MBC cartridge (see below).

The following MBC settings are available when using the makebin MBC switch.

```
# From Makebin source:
#
#-Wl-yt<NN> where <NN> is one of the numbers below
#
# 0147: Cartridge type:
# 0-ROM ONLY          12-ROM+MBC3+RAM
# 1-ROM+MBC1          13-ROM+MBC3+RAM+BATT
# 2-ROM+MBC1+RAM      19-ROM+MBC5
# 3-ROM+MBC1+RAM+BATT 1A-ROM+MBC5+RAM
# 5-ROM+MBC2          1B-ROM+MBC5+RAM+BATT
# 6-ROM+MBC2+BATTERY  1C-ROM+MBC5+RUMBLE
# 8-ROM+RAM           1D-ROM+MBC5+RUMBLE+SRAM
# 9-ROM+RAM+BATTERY   1E-ROM+MBC5+RUMBLE+SRAM+BATT
# B-ROM+MMM01         1F-Pocket Camera
# C-ROM+MMM01+SRAM    FD-Bandai TAMA5
# D-ROM+MMM01+SRAM+BATT FE - Hudson HuC-3
# F-ROM+MBC3+TIMER+BATT FF - Hudson HuC-1
# 10-ROM+MBC3+TIMER+RAM+BATT
# 11-ROM+MBC3
```

6.2.4 Banked Functions

Banked functions can be called as follows.

- When defined with the `BANKED` keyword. Example: `void my_function() BANKED { do stuff }` in a source file which has had it's bank set (see above).
- Using [far_pointers](#)
- When defined with an area set up using the `__addressmod` keyword (See the `banks_new` example project and the SDCC manual for details)
- Using [SWITCH_ROM_MBC1\(\)](#) (and related functions for other MBCs) to manually switch in the required bank and then call the function.

Unbanked functions (either in fixed Bank 0, or in an Unbanked ROM with no MBC)

- May call functions in any bank: **YES**
- May use data in any bank: **YES**

Todo Fill in this info for Banked Functions Banked functions (located in a switchable ROM bank)

- May call functions in any bank: ?
- May use data in any bank: **NO** (may only use data from currently active banks)

Limitations:

- SDCC banked calls and `far_pointers` in GBDK only save one byte for the ROM bank. So, for example, they are limited to **bank 31** max for MBC1 and **bank 255** max for MBC5. This is due to the bank switching for those MBCs requiring a second, additional write to select the upper bits for more banks (banks 32+ in MBC1 and banks 256+ in MBC5).

6.2.5 Const Data (Variables in ROM)

Todo Const Data (Variables in ROM)

6.2.6 Variables in RAM

Todo Variables in RAM

6.2.7 Far Pointers

Far pointers include a segment (bank) selector so they are able to point to addresses (functions or data) outside of the current bank (unlike normal pointers which are not bank-aware). A set of macros is provided by GBDK 2020 for working with far pointers.

Warning: Do not call the far pointer function macros from inside interrupt routines (ISRs). The far pointer function macros use a global variable that would not get restored properly if a function called that way was interrupted by another one called the same way. However, they may be called recursively.

See [FAR_CALL](#), [TO_FAR_PTR](#) and the `banks_farptr` example project.

6.2.8 Bank switching

You can manually switch banks using the [SWITCH_ROM_MBC1\(\)](#), [SWITCH_RAM_MBC1\(\)](#), and other related macros. See `banks.c` project for an example.

Note: You can only do a `switch_rom_bank` call from unbanked `_CODE` since otherwise you would switch out the code that was executing. Global routines that will be called without an expectation of bank switching should fit within the limited 16k of unbanked `_CODE`.

6.2.9 Restoring the current bank (after calling functions which change it without restoring)

If a function call is made (for example inside an ISR) which changes the bank *without* restoring it, then the `_current_bank` variable should be saved and then restored.

For example, **instead** of this code:

```
void vbl_music_isr(void)
{
    // A function which changes the bank and
    // *doesn't* restore it after changing.
    some_function();
}
```

It should be:

```
void vbl_music_isr(void)
{
    // Save the current bank
    UBYTE _saved_bank = _current_bank;
    // A function which changes the bank and
    // *doesn't* restore it after changing.
    some_function();
    // Now restore the current bank
    SWITCH_ROM_MBC5(_saved_bank);
}
```

6.2.10 Currently active bank: `_current_bank`

The global variable `_current_bank` is updated automatically when calling [SWITCH_ROM_MBC1\(\)](#) and [SWITCH_ROM_MBC5](#), or when a `BANKED` function is called.

6.3 Auto-Banking

A ROM bank auto-assignment feature was added in GBDK 2020 4.0.2.

Instead of having to manually specify which bank a source file will reside in, the banks can be assigned automatically to make the best use of space. The bank assignment operates on object files, after compiling/assembling and before linking.

To turn on auto-banking, use the `-autobank` argument with `lcc`

For a source example see the `banks_autobank` project.

In the source files you want auto-banked, do the following:

- Set the bank for the source file to 255: `#pragma bank 255`
- Create a constant with no value to store the bank number for the source file: `const void __at(255) __bank_<name-for-a-given-source-file>;`.
This constant can then be used for obtaining that file's bank number with `(UINT8)&__bank_<name-for-a-given-source-file>`.

Example: `level_1_map.c`

```
#pragma bank 255
const void __at(255) __bank_level_1_map;

const UINT8 my_level_1_map[] = {... some map data here ...};
```

Accessing that data: `main.c`

```
SWITCH_ROM_MBC1( (UINT8)&__bank_level_1_map );
// Do something with my_level_1_map[]
```

Features and Notes:

- Fixed banked source files can be used in the same project as auto-banked source files. The `bankpack` tool will attempt to pack the auto-banked source files as efficiently as possible around the fixed-bank ones.

Making sure `bankpack` checks all files:

- In order to correctly calculate the bank for all files every time, it is best to use the `-ext=` flag and save the auto-banked output to a different extension (such as `.rel`) and then pass the modified files to the linker. That way all object files will be processed each time the program is compiled.

Recommended:

```
.c and .s -> (compiler) .o -> (bankpack) -> .rel -> (linker) ... -> .gb
```

- It is important because when `bankpack` assigns a bank for an autobanked (`bank=255`) object file (`.o`) it rewrites the bank and will then no longer see the file as one that needs to be auto-banked. That file will then remain in its previously assigned bank until a source change causes the compiler to rebuild it to an object file again which resets its bank to 255.
- For example consider a fixed-bank source file growing too large to share a bank with an auto-banked source file that was previously assigned to it. To avoid a bank overflow it would be important to have the auto-banked file check every time whether it can share that bank or not.
- See [bankpack](#) for more options and settings

Limitations:

- At this time, the constant entries that get rewritten with the assigned bank (`const void at(255) __bank_<name-you-want-to-use-for-that-source-file>;`) **cannot** be used from the source file they are declared in. In that case SDCC converts the bank number before `bankpack` has a chance to rewrite it. It may be referenced from any other source file, but not its own.

6.4 Errors related to banking (overflow, multiple writes to same location)

A *bank overflow* during compile/link time (in `makebin`) is when more code and data are allocated to a ROM bank than it has capacity for. The address for any overflowed data will be incorrect and the data is potentially unreachable since it now resides at the start of a different bank instead of the end of the expected bank.

See the [FAQ entry about bank overflow errors](#).

The current toolchain can only detect and warn (using `ihxcheck`) when one bank overflows into another bank that has data at its start. It cannot warn if a bank overflows into an empty one. For more complete detection, you can use the third-party `romusage` tool.

6.5 Bank space usage

In order to see how much space is used or remains available in a bank, you can use the third-party [romusage](#) tool.

6.5.1 Other important notes

- The [SWITCH_ROM_MBC5](#) macro is not interrupt-safe. If using less than 256 banks you may always use [SWITCH_ROM_MBC1](#) - that is faster. Even if you use mbc5 hardware chip in the cart.

6.6 Banking example projects

There are several projects in the GBDK 2020 examples folder which demonstrate different ways to use banking.

- `Banks`: A basic banking example
- `Banks_new`: Examples of using new bank assignment and calling conventions available in GBDK 2020 and it's updated SDCC version.
- `Banks_farptr`: Using far pointers which have the bank number built into the pointer.
- `Banks_autobank`: Shows how to use the bank auto-assignment feature of in GBDK 2020 4.0.2 or later, instead of having to manually specify which bank a source file will reside it.

Chapter 7

GBDK Toolchain

7.1 Overview

GBDK 2020 uses the SDCC compiler along with some custom tools to build Game Boy ROMs.

- All tools are located under `bin/`
- The typical order of tools called is as follows. (When using `lcc` these steps are usually performed automatically.)
 1. Compile and assemble source files (`.c`, `.s`, `.asm`) with [sdcc](#) and [sdasgb](#)
 2. Optional: perform auto banking with [bankpack](#) on the object files
 3. Link the object files into `.ihx` file with [sdlrgb](#)
 4. Validate the `.ihx` file with [ihxcheck](#)
 5. Convert the `.ihx` file to a ROM file (`.gb`, `.gbc`) with [makebin](#)

To see individual arguments and options for a tool, run that tool from the command line with either no arguments or with `-h`.

7.2 Data Types

For data types and special C keywords, see [asm/gbz80/types.h](#) and [asm/types.h](#).

Also see the SDCC manual (scroll down a little on the linked page): <http://sdcc.sourceforge.net/doc/sdccman.pdf#section.1.1>

7.3 Changing Important Addresses

It is possible to change some of the important addresses used by the toolchain at link time using the `-Wl-g XXX=YYY` and `=Wl-b XXX=YYY` flags (where `XXX` is the name of the data, and `YYY` is the new address).

`lcc` will include the following linker defaults for [sdlrgb](#) if they are not defined by the user.

- `_shadow_OAM`
 - Location of sprite ram (requires 0xA0 bytes).
 - Default `-Wl-g _shadow_OAM=0xC000`
- `.STACK`
 - Initial stack address
 - Default `-Wl-g .STACK=0xE000`
- `.refresh_OAM`
 - Address to which the routine for refreshing OAM will be copied (must be in HIRAM). Default

- Default `-Wl-g .refresh_OAM=0xFF80`
- `__DATA`
 - Start of RAM section (starts after Shadow OAM)
 - Default `-Wl-b __DATA=0xc0A0`
- `__CODE`
 - Start of ROM section
 - Default `-Wl-b __CODE=0x0200`

7.4 Compiling programs

The `lcc` program is the front end compiler driver for the actual compiler, assembler and linker. It works out what you want to do based on command line options and the extensions of the files you give it, computes the order in which the various programs must be called and then executes them in order. Some examples are:

- Compile the C source 'source.c', assemble and link it producing the Gameboy image 'image.gb'

```
lcc -o image.gb source.c
```

- Assemble the file 'source.s' and link it producing the Gameboy image 'image.gb'

```
lcc -o image.gb source.s
```

- Compile the C program 'source1.c' and assemble it producing the object file 'object1.o' for later linking.

```
lcc -c -o object1.o source1.c
```

- Assemble the file 'source2.s' producing the object file 'object2.o' for later linking

```
lcc -c -o object2.o source2.s
```

- Link the two object files 'object1.o' and 'object2.o' and produce the Gameboy image 'image.gb'

```
lcc -o image.gb object1.o object2.o
```

- Do all sorts of clever stuff by compiling then assembling source1.c, assembling source2.s and then linking them together to produce image.gb.

```
lcc -o image.gb source1.c source2.s
```

Arguments to the assembler etc can be passed via `lcc` using `-Wp...`, `-Wf...`, `-Wa...` and `-Wl...` to pass options to the pre-processor, compiler, assembler and linker respectively. Some common options are:

- To generate an assembler listing file.

```
-Wa-l
```

- To generate a linker map file.

```
-Wl-m
```

- To bind var to address 'addr' at link time.

```
-Wl-gvar=addr
```

For example, to compile the example in the memory section and to generate a listing and map file you would use the following. Note the leading underscore that C adds to symbol names.

```
lcc -Wa-l -Wl-m -Wl-g_snd_stat=0xff26 -o image.gb hardware.c
```

7.4.1 Makefiles

Using Makefiles

Please see the sample projects included with GBDK-2020 for a couple different examples of how to use Makefiles.

You may also want to read a tutorial on Makefiles. For example:

<https://makefiletutorial.com/> <https://www.tutorialspoint.com/makefile/index.htm>

7.5 Build Tools

7.5.1 lcc

lcc is the compiler driver (front end) for the GBDK/sdcc toolchain. It can be used to invoke all the tools needed for building a rom. If preferred, the individual tools can be called directly.

- the `-v` flag can be used to show the exact steps lcc executes for a build
- lcc can compile, link and generate a binary in a single pass: `lcc -o somerom.gb somesource.c`
- lcc now has a `-debug` flag that will turn on the following recommended flags for debugging
 - `--debug` for sdcc (lcc equiv: `-Wf-debug`)
 - `-y` enables `.cdb` output for `sdldgb` (lcc equiv: `-Wl-y`)
 - `-j` enables `.noi` output for `sdldgb` (lcc equiv: `-Wl-j`)

7.5.2 sdcc

SDCC C Source compiler

- Arguments can be passed to it through `lcc` using `-Wf-<argument>` and `-Wp-<argument>` (pre-processor)

7.5.3 sdasgb

SDCC Assembler for the gameboy

- Arguments can be passed to it through `lcc` using `-Wa-<argument>`

7.5.4 bankpack

Automatic Bank packer

When enabled, automatically assigns banks for object files where bank has been set to 255, see [rom_autobanking](#). Unless an alternative output is specified the given object files are updated with the new bank numbers.

- Can be enabled by using the `-autobank` argument with `lcc`.
- Must be called after compiling/assembling and before linking
- Arguments can be passed to it through `lcc` using `-Wb-<argument>`

Limitations

- `__banked` functions cannot be called from within the same source file they are declared in.
- With data it is easier, because if you access data from the code in the same bank you don't need to switch the bank (access to `__bank_*` symbol).

7.5.5 sldlgb

The SDCC linker for the gameboy.

Links object files (.o) into a .ihx file which can be processed by [makebin](#)

- Arguments can be passed to it through [lcc](#) using `-Wl-<argument>`

7.5.6 ihxcheck

IHX file validator

Checks .ihx files produced by [sldlgb](#) for correctness.

- It will warn if there are multiple writes to the same ROM address. This may indicate mistakes in the code or ROM bank overflows
- Arguments can be passed to it through [lcc](#) using `-Wi-<argument>`

7.5.7 makebin

IHX to ROM converter

Converts .ihx files produced by [sldlgb](#) into ROM files (.gb, .gbc).

- Arguments can be passed to it through [lcc](#) using `-Wm-<argument>`

7.6 GBDK Utilities

7.6.1 GBCompress

Compression utility

Compresses (and decompresses) binary file data with the gbcompress algorithm (also used in GBTD/GBMB). Decompression support is available in GBDK, see [gb_decompress\(\)](#).

7.6.2 PNG to Metasprite

Tool for converting PNGs into GBDK format MetaSprites

Todo Document png2mtspr

Chapter 8

Example Programs

GBDK includes several example programs both in C and in assembly. They are located in the examples directory, and in its subdirectories. They can be built by typing `make` in the corresponding directory.

8.1 banks (various projects)

There are several different projects showing how to use ROM banking with GBDK.

8.2 comm

Illustrates how to use communication routines.

8.3 crash

Demonstrates how to use the optional GBDK crash handler which dumps debug info to the Game Boy screen in the event of a program crash.

8.4 colorbar

The colorbar program, written by Mr. N.U. of TeamKNOx, illustrates the use of colors on a Color GameBoy.

8.5 dscan

Deep Scan is a game written by Mr. N.U. of TeamKNOx that supports the Color GameBoy. Your aim is to destroy the submarines from your boat, and to avoid the projectiles that they send to you. The game should be self-explanatory. The following keys are used:

```
RIGHT/LEFT : Move your boat
A/B         : Send a bomb from one side of your boat
START      : Start game or pause game
```

When game is paused:

```
SELECT      : Invert A and B buttons
RIGHT/LEFT  : Change speed
UP/DOWN     : Change level
```

8.6 filltest

Demonstrates various graphics routines.

8.7 fonts

Examples of how to work with the built in font and printing features.

8.8 galaxy

A C translation of the space.s assembly program.

8.9 gb-dtmf

The gb-dtmf, written by Osamu Ohashi, is a Dual Tone Multi-Frequency (DTMF) generator.

8.10 irq

Illustrates how to install interrupt handlers.

8.11 large map

Shows how to scroll with maps larger than 32 x 32 tiles using [set_bkg_submap\(\)](#). It fills rows and columns at the edges of the visible viewport (of the hardware Background Map) as it scrolls from the desired sub-region of the large map.

8.12 lcd isr wobble

An example of how to use the LCD ISR for visual special effects

8.13 paint

The paint example is a painting program. It supports different painting tools, drawing modes, and colors. At the moment, it only paints individual pixels. This program illustrates the use of the full-screen drawing library. It also illustrates the use of generic structures and big sprites.

```
Arrow keys : Move the cursor
SELECT     : Display/hide the tools palette
A          : Select tool
```

8.14 rand

The rand program, written by Luc Van den Borre, illustrates the use of the GBDK random generator.

8.15 ram_fn

The ram_fn example illustrates how to copy functions to RAM or HIRAM, and how to call them from C.

8.16 rpñ

A basic RPN calculator. Try entering expressions like 12 134* and then 1789+.

8.17 samptest

Demonstration of playing a sound sample.

8.18 sgb (various)

A collection of examples showing how to use the Super Game Boy API features.

8.19 sound

The sound example is meant for experimenting with the sound generator of the GameBoy (to use on a real GameBoy). The four different sound modes of the GameBoy are available. It also demonstrates the use of bit fields in C (it's a quick hack, so don't expect too much from the code). The following keys are used:

```
UP/DOWN      : Move the cursor
RIGHT/LEFT   : Increment/decrement the value
RIGHT/LEFT+A : Increment/decrement the value by 10
RIGHT/LEFT+B : Set the value to maximum/minimum
START        : Play the current mode's sound (or all modes if in control screen)
START+A      : Play a little music with the current mode's sound
SELECT       : Change the sound mode (1, 2, 3, 4 and control)
SELECT+A     : Dump the sound registers to the screen
```

8.20 space

The space example is an assembly program that demonstrates the use of sprites, window, background, fixed-point values and more. The following keys are used:

```
Arrow keys    : Change the speed (and direction) of the sprite
Arrow keys + A : Change the speed (and direction) of the window
Arrow keys + B : Change the speed (and direction) of the background
START         : Open/close the door
SELECT        : Basic fading effect
```

8.21 templates

Two basic template examples are provided as a starting place for writing your GBDK programs.

Chapter 9

Frequently Asked Questions (FAQ)

9.1 Frequently Asked Questions

- How do I set the ROM's title?
 - Use the [makebin](#) `-yn` flag. For example with `lcc -Wm-yn "MYTITLE"` or with [makebin](#) directly `-yn "MYTITLE"`. The maximum length is up to 15 characters, but may be shorter.
 - See "0134-0143 - Title" in [Pandocs](#) for more details.
- How do I set SGB, Color only and Color compatibility in the ROM header?
 - Use the following [makebin](#) flags. Prefix them with `-Wm` if using `lcc`.
 - * `-yc` : GameBoy Color compatible
 - * `-yC` : GameBoy Color only
 - * `-ys` : Super GameBoy compatible
- How do I set the ROM [MBC](#) type?
 - See [setting_mbc_and_rom_ram_banks](#)
- What do these kinds of warnings / errors mean? `WARNING: possibly wrote twice at addr 4000 (93->3E) Warning: Write from one bank spans into the next. 7ff7 -> 8016 (bank 1 -> 2)`

You may have a overflow in one of your ROM banks. If there is more data allocated to a bank than it can hold it then will spill over into the next bank. The warnings are generated by [ihxcheck](#) during conversion of an `.ihx` file into a ROM file.

See the section [ROM/RAM Banking and MBCs](#) for more details about how banks work and what their size is. You may want to use a tool such as [romusage](#) to calculate the amount of free and used space.
- Why is the compiler so slow, or why did it suddenly get much slower?
 - This may happen if you have large initialized arrays declared without the `const` keyword. It's important to use the `const` keyword for read-only data. See [const_gbtd_gbmb](#) and [const_array_data](#)

- What flags should be enabled for debugging?
 - You can use the [lcc debug flag](#)
- Why are 8 bit numbers not printing correctly with [printf\(\)](#)?
 - To correctly pass chars/uint8s for printing, they must be explicitly re-cast as such when calling the function. See docs_chars_varargs for more details.
- How can maps larger than 32x32 tiles be scrolled? & Why is the map wrapping around to the left side when setting a map wider than 32 tiles with [set_bkg_data\(\)](#)?
 - The hardware Background map is 32 x 32 tiles. The screen viewport that can be scrolled around that map is 20 x 18 tiles. In order to scroll around within a much larger map, new tiles must be loaded at the edges of the screen viewport in the direction that it is being scrolled. [set_bkg_submap](#) can be used to load those rows and columns of tiles from the desired sub-region of the large map.
 - See the "Large Map" example program and [set_bkg_submap\(\)](#)
 - Writes that exceed coordinate 31 of the Background tile map on the x or y axis will wrap around to the Left and Top edges.
- When using gbt_player with music in banks, how can the current bank be restored after calling gbt_update()? (since it changes the currently active bank without restoring it).
 - See [restoring the current bank](#)

Chapter 10

Migrating to new GBDK Versions

This section contains information that may be useful to know or important when upgrading to a newer GBDK release.

10.1 GBDK 2020 versions

10.1.1 Porting to GBDK 2020 4.0.3

- No significant changes required

10.1.2 Porting to GBDK 2020 4.0.2

- The default font has been reduced from 256 to 96 characters.
 - Code using special characters may need to be updated.
 - The off-by-1 character index offset was removed for fonts. Old fonts with the offset need to be re-adjusted.

10.1.3 Porting to GBDK 2020 4.0.1

- **Important!** : The `WRAM` memory region is no longer automatically initialized to zeros during startup.
 - Any variables which are declared without being initialized may have **indeterminate values instead of 0** on startup. This might reveal previously hidden bugs in your code.
 - Check your code for variables that are not initialized before use.
 - In BGB you can turn on triggering exceptions (options panel) reading from uninitialized RAM. This allows for some additional runtime detection of uninitialized vars.
- In `.ihx` files, multiple writes to the same ROM address are now warned about using [ihxcheck](#).
- `set_*_tiles()` now wrap maps around horizontal and vertical boundaries correctly. Code relying on it not wrapping correctly may be affected.

10.1.4 Porting to GBDK 2020 4.0

- GBDK now requires SDCC 4.0.3 or higher
- The old linker `link-gbz80` has been REMOVED, the linker [sdlrgb](#) from SDCC is used.
 - Due to the linker change, there are no longer warnings about multiple writes to the same ROM address.
- GBDK now generates `.ihx` files, those are converted to a ROM using [makebin](#) (lcc can do this automatically in some use cases)
- Setting ROM bytes directly with `-Wl-yp0x<address>=0x<value>` is no longer supported. Instead use [makebin](#) flags. For example, use `-Wm-yC` instead of `-Wl-yp0x143=0xC0`.
- OAM symbol has been renamed to `_shadow_OAM`, that allows accessing shadow OAM directly from C code

10.1.5 Porting to GBDK 2020 3.2

- No significant changes required

10.1.6 Porting to GBDK 2020 3.1.1

- No significant changes required

10.1.7 Porting to GBDK 2020 3.1

- No significant changes required

10.1.8 Porting to GBDK 2020 3.0.1

- LCC was upgraded to use SDCC v4.0. Makefile changes may be required
 - The symbol format changed. To get usable symbols turn on `.noi` output (LCC argument: `-wl-j`) can be enabled and you can use [noi2sym](#)
 - ?? Suggested: With LCC argument: `-Wa-l (sdasgb:-a All user symbols made global)`
 - In SDCC 3.6.0, the default for char changed from signed to unsigned.
 - * If you want the old behavior use `--fsigned-char`.
 - * lcc includes `--fsigned-char` by default
 - * Explicit declaration of unsigned vars is encouraged (for example, '15U' instead of '15')
 - `.init` address has been removed

10.2 Historical GBDK versions

10.2.1 GBDK 1.1 to GBDK 2.0

- Change your int variables to long if they have to be bigger than 255. If they should only contain values between 0 and 255, use an unsigned int.
- If your application uses the delay function, you'll have to adapt your delay values.
- Several functions have new names. In particular some of them have been changed to macros (e.g. `show_↵` `bkg()` is now `SHOW_BKG`).
- You will probably have to change the name of the header files that you include.

Chapter 11

GBDK Releases

The GBDK 2020 releases can be found on Github: <https://github.com/Zal0/gbdk-2020/releases>

11.1 GBDK 2020 Release Notes

11.1.1 GBDK 2020 4.0.3

2021/03

- Library
 - Added [set_vram_byte\(\)](#)
 - Added [set_bkg_tile_xy\(\)](#) / [set_win_tile_xy\(\)](#)
 - Added [get_bkg_xy_addr\(\)](#) / [get_win_xy_addr\(\)](#)
 - Added [get_bkg_submap\(\)](#) / [get_win_submap\(\)](#)
 - Added metasprite api support
 - Added [gb_decompress](#) support
 - Added [calloc](#) / [malloc](#) / [realloc](#) / [free](#) and generic [memmove](#)
 - Improved [printf\(\)](#): ignore %0 padding and %1-9 width specifier instead of not printing, support upper case X
 - Fixed [line\(\)](#): handle drawing when x1 is less than x2
- Examples
 - Added [large_map](#): showing how to use [set_bkg_submap\(\)](#)
 - Added [scroller](#): showing use of [get_bkg_xy_addr\(\)](#), [set_bkg_tile_xy\(\)](#) and [set_vram_byte](#)
 - Added [gbdecompress](#): de-compressing tile data into vram
 - Added template projects
 - Fixed build issue with [banks_autobank](#) example
 - Improved [sgb_border](#)
- Added [GBCompress](#) utility
- Added [png2metaspr](#) utility and metasprites example

11.1.2 GBDK 2020 4.0.2

2021/01/17

- Includes SDCC snapshot build version 12016 (has a fix for duplicate debug symbols generated from inlined header functions which GBDK 4.0+ uses)
- Updated documentation

- Library was improved
 - Linking with `stdio.h` does not require that much ROM now
 - Default font is changed to the smaller one (102 characters), that leaves space for user tiles
 - Fixed broken support for multiplying longs
 - `memset/memcpy` minor enhancements
 - safer copy-to-VRAM functions
 - loading of 1bit data fixed, also now it is possible to specify pixel color
 - Improved code generation for the GBDK Library with SDCC switch on by default: `--max-allocs-per-node 50000`
 - fixed wrong parameter offsets in `hiramcpy()` (broken `ram_function` example)
 - Multiple minor improvements
- New bankpack feature, allows automatic bank allocation for data and code, see `banks_autobank` example, feature is in beta state, use with care
- Lcc improvements
 - Fixed option to specify alternate base addresses for `shadow_OAM`, etc
- Examples: Added `bgb` debug example

11.1.3 GBDK 2020 4.0.1

2020/11/14

- Updated API documentation
- IHX is checked for correctness before the `makebin` stage. That allows to warn about overwriting the same ROM addresses (SDCC toolchain does not check this anymore).
- Library was improved
 - `set_*_tiles()` now wrap maps around horizontal and vertical boundaries correctly
 - new `fill_*_rect()` functions to clear rectangle areas
 - runtime initialization code now does not initialize whole WRAM with zeros anymore, that allows BGB to raise exceptions when code tries to read WRAM that was not written before.
 - enhanced SGB support
 - * `joypad_init()` / `joypad_ex()` support for multiple joypads
 - * SGB border example
 - `_current_bank` variable is updated when using bank switching macros
 - Reorganized examples: each example is in separate folder now, that simplifies understanding.
 - Lcc improvements
 - * Fix `-S` flag
 - * Fix default stack location from `0xDEFF` to `0xE000` (end of WRAM1)
 - * Fix cleanup of `.adb` files with `-Wf-debug` flag
 - * Fix output not working if target is `-o some_filename.ihx`

11.1.4 GBDK 2020 4.0

2020/10/01

- GBDK now requires SDCC 4.0.3 or higher, that has fully working toolchain. Old `link-gbz80` linker is not used anymore, `sdlldb` and `makebin` are used to link objects and produce binary roms; `maccr` tool is no longer needed either

- SDCC 4.0.3 has much better code generator which produces smaller and faster code. Code is twice faster
- SOURCE LEVEL DEBUGGING is possible now! Native toolchain produces *.CDB files that contain detailed debug info. Look for EMULICIOUS extension for vs.code. It supports breakpoints, watches, inspection of local variables, and more!
- SDCC 4.0.4 has fixed RGBDS support; library is not updated to support that in full yet, but it is possible to assemble and link code emitted by SDCC with RGBDS
- New banked trampolines are used, they are faster and smaller
- New (old) initialization for non-constant arrays do NOT require 5 times larger rom space than initialized array itself, SDCC even tries to compress the data
- Library was improved
 - itoa/lttoa functions were rewritten, div/mod is not required now which is about 10 times faster
 - sprite functions are inline now, which is faster up to 12 times and produces the same or smaller code; .OAM symbol is renamed into _shadow_OAM that allows accessing shadow OAM directly from C code
 - interrupt handling was revised, it is now possible to make dedicated ISR's, that is important for time-sensitive handlers such as HBlank.
 - printf/sprintf were rewritten and splitted, print functions are twice faster now and also require less rom space if you use [sprintf\(\)](#) only, say, in bgb_emu.h
 - crash_handler.h - crash handler that allows to detect problems with ROMs after they are being released (adapted handler, originally written by ISSOtm)
 - improved and fixed string.h
 - many other improvements and fixes - thanks to all contributors!
- Revised examples
- Improved linux support
- Lcc has been updated
 - it works with the latest version of sdcc
 - quoted paths with spaces are working now

11.1.5 GBDK 2020 3.2

2020/06/05

- Fixed OAM initialization that was causing a bad access to VRAM
- Interrupt handlers now wait for lcd controller mode 0 or 1 by default to prevent access to inaccessible VRAM in several functions (like set_bkg_tiles)
- Several optimizations here and there

11.1.6 GBDK 2020 3.1.1

2020/05/17

- Fixed issues with libgcc_s_dw2-1.dll

11.1.7 GBDK 2020 3.1

2020/05/16

- Banked functions are working! The patcher is fully integrated in link-gbz80, no extra tools are needed. It is based on Toxa's work
 - Check this post for more info

- Check the examples/gb/banked code for basic usage
- USE_SFR_FOR_REG is the default now check here why <https://gbdev.gg8.se/forums/viewtopic.php?id=697>
- Fixed examples that were not compiling in the previous version and some improvements in a few of them. Removed all warnings caused by changing to the new SDCC
- Fixed bug in lcc that was causing some files in the temp folder not being deleted
- Removed as-gbz80 (the lib is now compiled with sdasgb thanks to this workaround) <https://github.com/Zal0/gbdk-2020/commit/d2caafa4a66eb08998a14b258cb66af041a0e5c8>
- Profile support with bgb emulator
 - Basic support including <gb/bgb_emu.h> and using the macros BGB_PROFILE_BEGIN and BGB_PROFILE_END. More info in this post <https://gbdev.gg8.se/forums/viewtopic.php?id=703>
 - For full profiling check this repo and this post https://github.com/untoxa/bgb_profiling_toolkit/blob/master/readme.md <https://gbdev.gg8.se/forums/viewtopic.php?id=710>

11.1.8 GBDK 2020 3.0.1

2020/04/12

- Updated SDCC to v.4.0
- Updated LCC to work with the new compiler

11.1.9 GBDK 2020 3.0

2020/04/12

- Initial GBDK 2020 release
Updated SDCC to v4.0 The new linker is not working so the old version is still there There is an issue with sdasgb compiling drawing.s (the JP in line 32 after ".org .MODE_TABLE+4*.G_MODE" it's writing more than 4 bytes invading some addresses required by input.s:41) Because of this, all .s files in libc have been assembled with the old as-gbz80 and that's why it is still included

11.2 Historical GBDK Release Notes

11.2.1 GBDK 2.96

17 April, 2000

Many changes.

- Code generated is now much more reliable and passes all of sdcc's regression suite.
- Added support for large sets of local variables (>127 bytes).
- Added full 32 bit long support.
- Still no floating pt support.

11.2.2 GBDK 2.95-3

19th August, 2000

- Stopped lcc with sdcc from leaking .cdb files all across /tmp.
- Optimised < and > for 16 bit variables.
- Added a new lexer to sdcc. Compiling files with large initialised arrays takes 31% of the time (well, at least samptest.c does :)

This is an experimental release for those who feel keen. The main change is a new lexer (the first part in the compilation process which recognises words and symbols like '!= ' and 'char' and turns them into a token number) which speeds up compilation of large initialised arrays like tile data by a factor of three. Please report any bugs that show up - this is a big change.

I have also included a 'minimal' release for win32 users which omits the documentation, library sources, and examples. If this is useful I will keep doing it.

11.2.3 GBDK 2.95-2

5th August, 2000

Just a small update. From the README:

- Added model switching support `--model-medium` uses near (16 bit) pointers for data, and banked calls for anything not declared as 'nonbanked' `--model-small` uses near (16 bit) pointers for data and calls. Nothing uses banked calls. 'nonbanked' functions are still placed in HOME. Libraries are under lib/medium and lib/small.
- Added the gbdk version to 'sdcc `--version`'
- Changed the ways globals are exported, reducing the amount of extra junk linked in.
- Turned on the optimisations in flex. Large constant arrays like tile data should compile a bit faster.

11.2.4 GBDK 2.95

22nd July, 2000

- Fixed 'a << c' for c = [9..15]
- no\$gmb doesn't support labels of > 32 chars. The linker now trims all labels to 31 chars long.
- Fixed wait_vbl for the case where you miss a vbl
- Fixed + and - for any type where sizeof == 2 and one of the terms was on the stack. This includes pointers and ints. Fixes the text output bug in the examples. Should be faster now as well. Note that + and - for longs is still broken.
- Fixed the missing */ in gb.h
- Added basic far function support. Currently only works for isas and rgbasm. See examples/gb/far/*
- bc is now only pushed if the function uses it. i.e. something like: `int silly(int i) { return i; }` will not have the push bc; pop bc around it.
- Better rgbasm support. Basically:
 - o Use "sdcc -mgbz80 --asm=rgbds file.c" for each file.c
 - o Use "sdcc -mgbz80 --asm=rgbds crt0.o gbz80.lib gb.lib file1.o file2.o..."

to link everything together. The .lib files are generated using astorgb.pl and sdcc to turn the gbdk libraries into something rgbds compatible. The libraries are *not* fully tested. Trust nothing. But give it a go :)

- Ran a spell checker across the README and ChangeLog

This is a recommended upgrade. Some of the big features are:

Decent rgbds support. All the libraries and most of the examples can now compile with rgbds as the assembler.
Banked function support. It is now easier to break the 32k barrier from within C. Functions can live in and be called transparently from any bank. Only works with rgbds Fixed some decent bugs with RSH, LSH, and a nasty bug with + and - for int's and pointers. Various optimisations in the code generator.

7th July, 2000

Information on float and long support. Someone asked about the state of float/long support recently. Heres my reply:

long support is partly there, as is float support. The compiler will correctly recognise the long and float keywords, and will generate the code for most basic ops (+, -, &, | etc) for longs correctly and will generate the function calls for floats and hard long operations (*, /, %) correctly. However it wont generate float constants in the correct format, nor will it 'return' a long or float - gbdk doesn't yet support returning types of 4 bytes. Unfortunately its not going to make it into 2.95 as there's too much else to do, but I should be able to complete long support for 2.96

11.2.5 GBDK 2.94

7th May, 2000

Many fixes - see the README for more.

7th May - Library documentation up. A good size part of the libraries that go with gbdk have been documented - follow the HTML link above to have a look. Thanks to quang for a good chunk of the gb.h documentation. Please report any errors :)

- Fixed #define BLAH 7 // Unterminated ' error in sdcpp
 - Fixed SCY_REG += 2, SCY_REG -= 5 (add and subtract in indirect space) as they were both quite broken.
 - externs and static's now work as expected.
 - You can now specify which bank code should be put into using a #pragma e.g: #pragma bank=HOME Under rgbds and asxxxx putting code in the HOME bank will force the code into bank 0 - useful for library functions. The most recent #pragma bank= will be the one used for the whole file.
 - Fixed an interesting bug in the caching of lit addresses
 - Added support for accessing high registers directly using the 'sfr' directive. See libc/gb/sfr.s and gb/hardware.h for an example. It should be possible with a bit of work to make high ram directly usable by the compiler; at the moment it is experimental. You can test sfr's by enabling USE_SFR_FOR_RAM EG=1
 - Added remove_VBL etc functions.
 - Documented the libs - see the gbdk-doc tarball distributed seperatly.
 - Two dimensional arrays seem to be broken.

11.2.6 GBDK 2.93

6th April, 2000

From the README

- Added multi-bank support into the compiler - The old -Wf-boxx and -Wf-baxx options now work
- Has preliminary support for generating rgbds and ISAS compatible assembler. Try -Wasm=rgbds or -Wasm=isas. The ISAS code is untested as I dont have access to the real assembler.
- RSH is fixed
- AND is fixed
- The missing parts of 2.1.0's libs are there. Note: They are untested.
- The dscan demo now fully works (with a hack :)
- There is a bug with cached computed values which are later used as pointers. When the value is first used as a BYTE arg, then later as a pointer the pointer fails as the high byte was never computed and is now missing. A temporary fix is to declare something appropriate as 'volatile' to stop the value being cached. See dscan.c/bombs() for an example.

11.2.7 GBDK 2.92-2 for win32

26th March, 2000

This is a maintenance release for win32 which fixes some of the niggly install problems, especially:

- win32 only. Takes care of some of the install bugs, including:
 - Now auto detects where it is installed. This can be overridden using set GBDKDIR=...
 - Problems with the installer (now uses WinZip)
 - Problems with the temp directory Now scans TMP, TEMP, TMPDIR and finally c: tmp
 - cygwin1.dll and 'make' are no longer required gbdk is now built using mingw32 which is win32 native make.bat is automatically generated from the Makefile
 - I've reverted to using WORD for signed 16 bit etc. GBDK_2_COMPAT is no longer required.

WORDS are now back to signed. GBDK_2_COMPAT is no longer needed. Temporary files are created in TMP, TEMP, or TMPDIR instead of c: tmp The installer is no more as it's not needed. There is a WinZip wrapped version for those with the extra bandwidth :). gbdk autodetects where it is installed - no more environment variables. cygwin1.dll and make are no longer required - gbdk is now compiled with mingw32.

See the ChangeLog section in the README for more information.

21st March, 2000

Problems with the installer. It seems that the demo of InstallVISE has an unreasonably short time limit. I had planed to use the demo until the license key came through, but there's no sign of the key yet and the 3 day evaluation is up. If anyone knows of a free Windows installer with the ability to modify environment variables, please contact me. I hear that temporarily setting you clock back to the 15th works...

18th March, 2000

libc5 version available / "Error creating temp file" Thanks to Rodrigo Couto there is now a Linux/libc5 version of gbdk3-2.92 available - follow the download link above. At least it will be there when the main sourceforge site comes back up... Also some people have reported a bug where the compiler reports '*** Error creating temp file'. Try typing "mkdir c: tmp" from a DOS prompt and see if that helps.

11.2.8 GBDK 2.92

8th March, 2000

Better than 2.91 :). Can now be installed anywhere. All the demos work. See the README for more.

- All the examples now work (with a little bit of patching :)
 - Fixed problem with registers being cached instead of being marked volatile.
 - More register packing - should be a bit faster.
 - You can now install somewhere except c: gbdk | /usr/lib/gbdk
 - Arrays initialised with constant addresses a'la galaxy.c now work.
 - Fixed minor bug with 104\$: labels in as.
 - Up to 167d/s...

11.2.9 GBDK 2.91

27th Feb, 2000

Better than 2.90 and includes Linux, win32 and a source tar ball. Some notes:

Read the README first Linux users need libgc-4 or above. Debian users try apt-get install libgc5. All the types have changed. Again, please read the README first. I prefer release early, release often. The idea is to get the bugs out there so that they can be squashed quickly. I've split up the libs so that they can be used on other platforms and so that the libs can be updated without updating the compiler. One side effect is that gb specific files have been shifted into their own directory i.e. gb.h is now gb/gb.h.

23rd Feb, 2000

First release of gbdk/sdcc. This is an early release - the only binary is for Linux and the source is only available through cvs. If your interested in the source, have a look at the cvs repository gbdk-support first, which will download all the rest of the code. Alternatively, look at gbdk-support and gbdk-lib at cvs.gbdk.sourceforge.net and sdcc at

cvs.sdcc.sourceforge.net. I will be working on binaries for Win32 and a source tar ball soon. Please report any bugs through the bugs link above.

31st Jan, 2000

Added Dermot's far pointer spec. It's mainly here for comment. If sdcc is ported to the Gameboy then I will be looking for some way to do far calls.

8th Jan, 2000

Moved over to sourceforge.net. Thanks must go to David Pfeffer for gbdk's previous resting place, www.gbdev.org. The transition is not complete, but cvs and web have been shifted. Note that the cvs download instructions are stale - you should now look to cvs.gbdk.sourceforge.net. I am currently working on porting sdcc over to the Z80. David Nathan is looking at porting it to the GB.

6th Jan, 2000

Icehawk wrote "I did write some rumble pack routines. Just make sure to remind people to add -Wl-yl0x1C or -Wl-yl0x1D or -Wl-yl0x1E depending on sram and battery usage. Find the routines on my site (as usual). =)"

18th Oct, 1999

Bug tracking / FAQ up. Try the link on the left to report any bugs with GBDK. It's also the first place to look if your having problems.

11.2.10 GBDK 2.1.5

17th Oct, 1999

The compiler is the same, but some of the libraries have been improved. [memset\(\)](#) and [memcpy\(\)](#) are much faster, [malloc\(\)](#) is fixed, and a high speed fixed block alternative [m_malloc\(\)](#) was added.

Chapter 12

Todo List

Page [Coding Guidelines](#)

Update and verify this section for the modernized SDCC and toolchain

File [far_ptr.h](#)

Add link to a discussion about banking (such as, how to assign code and variables to banks)

Page [GBDK Toolchain](#)

Chapter 16

Module Documentation

16.1 List of gbdk fonts

16.1.1 Description

Variables

- `UINT8 font_spect[]`
- `UINT8 font_italic[]`
- `UINT8 font_ibm[]`
- `UINT8 font_min[]`
- `UINT8 font_ibm_fixed[]`

16.1.2 Variable Documentation

16.1.2.1 font_spect

`UINT8 font_spect[]`

The default fonts

16.1.2.2 font_italic

`UINT8 font_italic[]`

16.1.2.3 font_ibm

`UINT8 font_ibm[]`

16.1.2.4 font_min

`UINT8 font_min[]`

16.1.2.5 font_ibm_fixed

`UINT8 font_ibm_fixed[]`

Backwards compatible font

Chapter 17

Data Structure Documentation

17.1 `__far_ptr` Union Reference

```
#include <far_ptr.h>
```

Data Fields

- `FAR_PTR ptr`
- struct {
 void * `ofs`
 unsigned int `seg`
} `segofs`
- struct {
 void(* `fn`)()
 unsigned int `seg`
} `segfn`

17.1.1 Detailed Description

Union for working with members of a FAR_PTR

17.1.2 Field Documentation

17.1.2.1 `ptr`

```
FAR_PTR __far_ptr::ptr
```

17.1.2.2 `ofs`

```
void* __far_ptr::ofs
```

17.1.2.3 `seg`

```
unsigned int __far_ptr::seg
```

17.1.2.4 segofs

```
struct { ... } __far_ptr::segofs
```

17.1.2.5 fn

```
void(* __far_ptr::fn) ()
```

17.1.2.6 segfn

```
struct { ... } __far_ptr::segfn
```

The documentation for this union was generated from the following file:

- [gb/far_ptr.h](#)

17.2 _fixed Union Reference

```
#include <types.h>
```

Data Fields

- struct {
 [UBYTE](#) [I](#)
 [UBYTE](#) [h](#)
} [b](#)
- [UWORD](#) [w](#)

17.2.1 Detailed Description

Useful definition for fixed point values

17.2.2 Field Documentation**17.2.2.1 I**

```
UBYTE __fixed::l
```

17.2.2.2 h

```
UBYTE __fixed::h
```

17.2.2.3 b

```
struct { ... } __fixed::b
```

17.2.2.4 w

```
UWORD __fixed::w
```

The documentation for this union was generated from the following file:

- [asm/types.h](#)

17.3 atomic_flag Struct Reference

```
#include <stdatomic.h>
```

Data Fields

- unsigned char [flag](#)

17.3.1 Field Documentation

17.3.1.1 flag

```
unsigned char atomic_flag::flag
```

The documentation for this struct was generated from the following file:

- [stdatomic.h](#)

17.4 joypads_t Struct Reference

```
#include <gb.h>
```

Data Fields

- [UINT8 npads](#)
 - union {
 - struct {
 - [UINT8 joy0](#)
 - [UINT8 joy1](#)
 - [UINT8 joy2](#)
 - [UINT8 joy3](#)
 - [UINT8 joypads](#) [4]
- ```
};
```

### 17.4.1 Detailed Description

Multiplayer joystick structure.

Must be initialized with [joypad\\_init\(\)](#) first then it may be used to poll all available joypads with [joypad\\_ex\(\)](#)

### 17.4.2 Field Documentation

#### 17.4.2.1 npads

```
UINT8 joypads_t::npads
```

#### 17.4.2.2 joy0

```
UINT8 joypads_t::joy0
```

#### 17.4.2.3 joy1

`UINT8 joypads_t::joy1`

#### 17.4.2.4 joy2

`UINT8 joypads_t::joy2`

#### 17.4.2.5 joy3

`UINT8 joypads_t::joy3`

#### 17.4.2.6 joypads

`UINT8 joypads_t::joypads[4]`

#### 17.4.2.7 "@4

`union { ... }`

The documentation for this struct was generated from the following file:

- [gb/gb.h](#)

## 17.5 metasprite\_t Struct Reference

```
#include <metasprites.h>
```

### Data Fields

- [INT8 dy](#)
- [INT8 dx](#)
- [UINT8 dtile](#)
- [UINT8 props](#)

### 17.5.1 Detailed Description

metasprite item description

### 17.5.2 Field Documentation

#### 17.5.2.1 dy

`INT8 metasprite_t::dy`

#### 17.5.2.2 dx

`INT8 metasprite_t::dx`

#### 17.5.2.3 dtile

`UINT8 metasprite_t::dtile`

#### 17.5.2.4 props

UINT8 metasprite\_t::props

The documentation for this struct was generated from the following file:

- gb/[metasprites.h](#)

## 17.6 OAM\_item\_t Struct Reference

```
#include <gb.h>
```

### Data Fields

- [UINT8 y](#)
- [UINT8 x](#)
- [UINT8 tile](#)
- [UINT8 prop](#)

### 17.6.1 Detailed Description

Sprite Attributes structure

#### Parameters

|             |                                                           |
|-------------|-----------------------------------------------------------|
| <i>x</i>    | X Coordinate of the sprite on screen                      |
| <i>y</i>    | Y Coordinate of the sprite on screen                      |
| <i>tile</i> | Sprite tile number (see <a href="#">set_sprite_tile</a> ) |
| <i>prop</i> | OAM Property Flags (see <a href="#">set_sprite_prop</a> ) |

### 17.6.2 Field Documentation

#### 17.6.2.1 y

UINT8 OAM\_item\_t::y

#### 17.6.2.2 x

UINT8 OAM\_item\_t::x

#### 17.6.2.3 tile

UINT8 OAM\_item\_t::tile

#### 17.6.2.4 prop

UINT8 OAM\_item\_t::prop

The documentation for this struct was generated from the following file:

- gb/[gb.h](#)

## 17.7 sfont\_handle Struct Reference

```
#include <font.h>
```

### Data Fields

- [UINT8 first\\_tile](#)
- void \* [font](#)

### 17.7.1 Detailed Description

Font handle structure

### 17.7.2 Field Documentation

#### 17.7.2.1 first\_tile

[UINT8](#) sfont\_handle::first\_tile

First tile used for font

#### 17.7.2.2 font

void\* sfont\_handle::font

Pointer to the base of the font

The documentation for this struct was generated from the following file:

- [gb/font.h](#)

## 17.8 smalloc\_hunk Struct Reference

```
#include <malloc.h>
```

### Data Fields

- [UBYTE magic](#)
- [pmmalloc\\_hunk next](#)
- [UWORD size](#)
- int [status](#)

### 17.8.1 Field Documentation

#### 17.8.1.1 magic

[UBYTE](#) smalloc\_hunk::magic

#### 17.8.1.2 next

[pmmalloc\\_hunk](#) smalloc\_hunk::next

#### 17.8.1.3 size

[UWORD](#) smalloc\_hunk::size

#### 17.8.1.4 status

```
int smalloc_hunk::status
```

The documentation for this struct was generated from the following file:

- gb/[malloc.h](#)

- typedef [UINT32](#) [ULWORD](#)
- typedef [INT32](#) [DWORD](#)
- typedef [UINT32](#) [UDWORD](#)
- typedef union [\\_fixed](#) [fixed](#)

### 18.16.1 Detailed Description

Shared types definitions.

### 18.16.2 Typedef Documentation

#### 18.16.2.1 BOOLEAN

typedef [INT8](#) [BOOLEAN](#)  
TRUE or FALSE.

#### 18.16.2.2 BYTE

typedef [INT8](#) [BYTE](#)  
Signed 8 bit.

#### 18.16.2.3 UBYTE

typedef [UINT8](#) [UBYTE](#)  
Unsigned 8 bit.

#### 18.16.2.4 WORD

typedef [INT16](#) [WORD](#)  
Signed 16 bit

#### 18.16.2.5 UWORD

typedef [UINT16](#) [UWORD](#)  
Unsigned 16 bit

#### 18.16.2.6 LWORD

typedef [INT32](#) [LWORD](#)  
Signed 32 bit

#### 18.16.2.7 ULWORD

typedef [UINT32](#) [ULWORD](#)  
Unsigned 32 bit

#### 18.16.2.8 DWORD

typedef [INT32](#) [DWORD](#)  
Signed 32 bit

### 18.16.2.9 UDWORD

```
typedef UINT32 UDWORD
```

Unsigned 32 bit

### 18.16.2.10 fixed

```
typedef union _fixed fixed
```

Useful definition for fixed point values

## 18.17 types.h File Reference

```
#include <asm/types.h>
```

### Macros

- #define NULL 0
- #define FALSE 0
- #define TRUE 1

### Typedefs

- typedef void \* POINTER

### 18.17.1 Detailed Description

Basic types.  
Directly include the port specific file.

### 18.17.2 Macro Definition Documentation

#### 18.17.2.1 NULL

```
#define NULL 0
```

Good 'ol NULL.

#### 18.17.2.2 FALSE

```
#define FALSE 0
```

A 'false' value.

#### 18.17.2.3 TRUE

```
#define TRUE 1
```

A 'true' value.

### 18.17.3 Typedef Documentation

#### 18.17.3.1 POINTER

```
typedef void* POINTER
```

No longer used.

## 18.18 assert.h File Reference

### Macros

- #define `assert(x)` `((x) ? (void)0 : __assert(#x, __func__, __FILE__, __LINE__))`

### Functions

- void `__assert` (const char \*expression, const char \*functionname, const char \*filename, unsigned int linenumber)

### 18.18.1 Macro Definition Documentation

#### 18.18.1.1 `assert`

```
#define assert(
 x) ((x) ? (void)0 : __assert(#x, __func__, __FILE__, __LINE__))
```

### 18.18.2 Function Documentation

#### 18.18.2.1 `__assert()`

```
void __assert (
 const char * expression,
 const char * functionname,
 const char * filename,
 unsigned int linenumber)
```

## 18.19 bcd.h File Reference

```
#include <asm/types.h>
```

### Macros

- #define `BCD_HEX(v)` `((BCD)(v))`
- #define `MAKE_BCD(v)` `BCD_HEX(0x ## v)`

### Typedefs

- typedef unsigned long `BCD`

### Functions

- void `uint2bcd` (unsigned int i, `BCD` \*value)
- void `bcd_add` (`BCD` \*sour, const `BCD` \*value)
- void `bcd_sub` (`BCD` \*sour, const `BCD` \*value)
- `UBYTE` `bcd2text` (const `BCD` \*bcd, `UBYTE` tile\_offset, unsigned char \*buffer)

### 18.19.1 Detailed Description

Support for working with BCD (Binary Coded Decimal)  
See the example BCD project for additional details.

## 18.19.2 Macro Definition Documentation

### 18.19.2.1 BCD\_HEX

```
#define BCD_HEX(
 v) ((BCD)(v))
```

### 18.19.2.2 MAKE\_BCD

```
#define MAKE_BCD(
 v) BCD_HEX(0x ## v)
```

Converts an integer value into BCD format

A maximum of 8 digits may be used

## 18.19.3 Typedef Documentation

### 18.19.3.1 BCD

```
typedef unsigned long BCD
```

## 18.19.4 Function Documentation

### 18.19.4.1 uint2bcd()

```
void uint2bcd (
 unsigned int i,
 BCD * value)
```

Converts integer *i* into BCD format (Binary Coded Decimal)

#### Parameters

|              |                                                         |
|--------------|---------------------------------------------------------|
| <i>i</i>     | Numeric value to convert                                |
| <i>value</i> | Pointer to a BCD variable to store the converted result |

### 18.19.4.2 bcd\_add()

```
void bcd_add (
 BCD * sour,
 const BCD * value)
```

Adds two numbers in BCD format: **sour** += **value**

#### Parameters

|              |                                                                   |
|--------------|-------------------------------------------------------------------|
| <i>sour</i>  | Pointer to a BCD value to add to (and where the result is stored) |
| <i>value</i> | Pointer to the BCD value to add to <b>sour</b>                    |

### 18.19.4.3 bcd\_sub()

```
void bcd_sub (
 BCD * sour,
 const BCD * value)
```

Subtracts two numbers in BCD format: **sour -= value**

#### Parameters

|              |                                                                          |
|--------------|--------------------------------------------------------------------------|
| <i>sour</i>  | Pointer to a BCD value to subtract from (and where the result is stored) |
| <i>value</i> | Pointer to the BCD value to subtract from <b>sour</b>                    |

### 18.19.4.4 bcd2text()

```
UBYTE bcd2text (
 const BCD * bcd,
 UBYTE tile_offset,
 unsigned char * buffer)
```

Convert a BCD number into an asciiz (null terminated) string and return the length

#### Parameters

|                    |                                                             |
|--------------------|-------------------------------------------------------------|
| <i>bcd</i>         | Pointer to BCD value to convert                             |
| <i>tile_offset</i> | Optional per-character offset value to add (use 0 for none) |
| <i>buffer</i>      | Buffer to store the result in                               |

Returns: Length in characters (always 8)

**buffer** should be large enough to store the converted string (9 bytes: 8 characters + 1 for terminator)

There are a couple different ways to use **tile\_offset**. For example:

- It can be the Index of the Font Tile '0' in VRAM to allow the buffer to be used directly with [set\\_bkg\\_tiles](#).
- It can also be set to the ascii value for character '0' so that the buffer is a normal string that can be passed to [printf](#).

## 18.20 ctype.h File Reference

```
#include <types.h>
```

### Functions

- [BOOLEAN isalpha](#) (char *c*)
- [BOOLEAN isupper](#) (char *c*)
- [BOOLEAN islower](#) (char *c*)
- [BOOLEAN isdigit](#) (char *c*)
- [BOOLEAN isspace](#) (char *c*)
- char [toupper](#) (char *c*)
- char [tolower](#) (char *c*)

### 18.20.1 Detailed Description

Character type functions.

## 18.20.2 Function Documentation

### 18.20.2.1 isalpha()

```
BOOLEAN isalpha (
 char c)
```

Returns TRUE if the character **c** is a letter (a-z, A-Z), otherwise FALSE

#### Parameters

|          |                   |
|----------|-------------------|
| <b>c</b> | Character to test |
|----------|-------------------|

### 18.20.2.2 isupper()

```
BOOLEAN isupper (
 char c)
```

Returns TRUE if the character **c** is an uppercase letter (A-Z), otherwise FALSE

#### Parameters

|          |                   |
|----------|-------------------|
| <b>c</b> | Character to test |
|----------|-------------------|

### 18.20.2.3 islower()

```
BOOLEAN islower (
 char c)
```

Returns TRUE if the character **c** is a lowercase letter (a-z), otherwise FALSE

#### Parameters

|          |                   |
|----------|-------------------|
| <b>c</b> | Character to test |
|----------|-------------------|

### 18.20.2.4 isdigit()

```
BOOLEAN isdigit (
 char c)
```

Returns TRUE if the character **c** is a digit (0-9), otherwise FALSE

#### Parameters

|          |                   |
|----------|-------------------|
| <b>c</b> | Character to test |
|----------|-------------------|

### 18.20.2.5 isspace()

```
BOOLEAN isspace (
 char c)
```

Returns TRUE if the character **c** is a space (' '), tab (\t), or newline (\n) character, otherwise FALSE

## Parameters

|                |                   |
|----------------|-------------------|
| <code>c</code> | Character to test |
|----------------|-------------------|

**18.20.2.6 toupper()**

```
char toupper (
 char c)
```

Returns uppercase version of character `c` if it is a letter (a-z), otherwise it returns the input value unchanged.

## Parameters

|                |                   |
|----------------|-------------------|
| <code>c</code> | Character to test |
|----------------|-------------------|

**18.20.2.7 tolower()**

```
char tolower (
 char c)
```

Returns lowercase version of character `c` if it is a letter (A-Z), otherwise it returns the input value unchanged.

## Parameters

|                |                   |
|----------------|-------------------|
| <code>c</code> | Character to test |
|----------------|-------------------|

**18.21 gb/bgb\_emu.h File Reference****Macros**

- #define `BGB_MESSAGE`(message\_text) `BGB_MESSAGE1`(`BGB_ADD_DOLLARD`(`__LINE__`), message↵  
\_text)
- #define `BGB_MESSAGE_FMT`(buf, ...) `sprintf`(buf, `__VA_ARGS__`);`BGB_MESSAGE2`(`BGB_ADD_DOLL`↵  
`ARD`(`__LINE__`), `BGB_MAKE_LABEL`(`##buf`));
- #define `BGB_PROFILE_BEGIN`(MSG) `BGB_MESSAGE`(`BGB_CONCAT`(MSG,%ZEROCLKS%));
- #define `BGB_PROFILE_END`(MSG) `BGB_MESSAGE`(`BGB_CONCAT`(MSG,%-8+LASTCLKS%));
- #define `BGB_TEXT`(MSG) `BGB_MESSAGE`(`BGB_STR`(MSG))

**Functions**

- void `BGB_profiler_message` ()

**18.21.1 Detailed Description**

Debug window logging and profiling support for the BGB emulator.

Also see the `bgb_debug` example project included with `gbdk`.

See the BGB Manual for more information ("expressions, breakpoint conditions, and debug messages") [http↵  
://bgb.bircd.org/manual.html#expressions](http://bgb.bircd.org/manual.html#expressions)

**18.21.2 Macro Definition Documentation**

### 18.21.2.1 BGB\_MESSAGE

```
#define BGB_MESSAGE(
 message_text) BGB_MESSAGE1(BGB_ADD_DOLLARD(__LINE__), message_text)
```

Macro to display a message in the BGB emulator debug message window

#### Parameters

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <i>message_text</i> | Quoted text string to display in the debug message window |
|---------------------|-----------------------------------------------------------|

The following special parameters can be used when bracketed with "%" characters.

- CPU registers: AF, BC, DE, HL, SP, PC, B, C, D, E, H, L, A, ZERO, ZF, Z, CARRY, CY, IME, ALLREGS
- Other state values: ROMBANK, XRAMBANK, SRAMBANK, WRAMBANK, VRAMBANK, TOTALCLKS, LA↵STCLKS, CLK2VBLANK

Example: print a message along with the currently active ROM bank.

```
BGB_MESSAGE("Current ROM Bank is: %ROMBANK%");
```

See the BGB Manual for more information ("expressions, breakpoint conditions, and debug messages") [http↵://bgb.bircd.org/manual.html#expressions](http://bgb.bircd.org/manual.html#expressions)

See also

[BGB\\_PROFILE\\_BEGIN\(\)](#), [BGB\\_PROFILE\\_END\(\)](#)

### 18.21.2.2 BGB\_MESSAGE\_FMT

```
#define BGB_MESSAGE_FMT(
 buf,
 ...) sprintf(buf, __VA_ARGS__);BGB_MESSAGE2(BGB_ADD_DOLLARD(__LINE__), BGB_MA↵
KE_LABEL(_##buf));
```

Macro to display a sprintf formatted message in the BGB emulator debug message window

#### Parameters

|            |                                           |
|------------|-------------------------------------------|
| <i>buf</i> | Pointer to a globally defined char buffer |
| ...        | VA Args list of sprintf parameters        |

To avoid buffer overflows **buf** must be large enough to store the entire printed message.

Example:

```
char mybuf[100]; // should be globally defined
BGB_MESSAGE_FMT(mybuf, "An integer:%d, a string: %s", 12345, "hello bgb")
```

See also

[BGB\\_MESSAGE\(\)](#)

### 18.21.2.3 BGB\_PROFILE\_BEGIN

```
#define BGB_PROFILE_BEGIN(
 MSG) BGB_MESSAGE(BGB_CONCAT(MSG,%ZEROCLKS%));
```

Macro to **Start** a profiling block for the BGB emulator

#### Parameters

|            |                                                           |
|------------|-----------------------------------------------------------|
| <i>MSG</i> | Quoted text string to display in the debug message window |
|------------|-----------------------------------------------------------|

To complete the profiling block and print the result call [BGB\\_PROFILE\\_END](#).

See also

[BGB\\_PROFILE\\_END\(\)](#), [BGB\\_MESSAGE\(\)](#)

#### 18.21.2.4 BGB\_PROFILE\_END

```
#define BGB_PROFILE_END(
 MSG) BGB_MESSAGE (BGB_CONCAT (MSG, %-8+LASTCLKS%));
```

Macro to **End** a profiling block and print the results in the BGB emulator debug message window

Parameters

|            |                                                                                 |
|------------|---------------------------------------------------------------------------------|
| <i>MSG</i> | Quoted text string to display in the debug message window along with the result |
|------------|---------------------------------------------------------------------------------|

This should only be called after a previous call to [BGB\\_PROFILE\\_BEGIN\(\)](#)

The results are in BGB clock units, which are "1 nop in [CGB] doublespeed mode".

So when running in Normal Speed mode (i.e. non-CGB doublespeed) the printed result should be **divided by 2** to get the actual ellapsed cycle count.

If running in CB Double Speed mode use the below call instead, it correctly compensates for the speed difference.

In this scenario, the result does **not need to be divided by 2** to get the ellapsed cycle count.

```
BGB_MESSAGE ("NOP TIME: %-4+LASTCLKS%");
```

See also

[BGB\\_PROFILE\\_BEGIN\(\)](#), [BGB\\_MESSAGE\(\)](#)

#### 18.21.2.5 BGB\_TEXT

```
#define BGB_TEXT(
 MSG) BGB_MESSAGE (BGB_STR (MSG))
```

### 18.21.3 Function Documentation

#### 18.21.3.1 BGB\_profiler\_message()

```
void BGB_profiler_message ()
```

Display preset debug information in the BGB debug messages window.

This function is equivalent to:

```
BGB_MESSAGE ("PROFILE, %(SP+$0) %, %(SP+$1) %, %A%, %TOTALCLKS%, %ROMBANK%, %WRAMBANK%");
```

## 18.22 gb/cgb.h File Reference

```
#include <types.h>
```

### Macros

- void `cpu_fast` (void)
- void `cgb_compatibility` (void)

### 18.22.1 Detailed Description

Support for the Color GameBoy (CGB).

#### Enabling CGB features

To unlock and use CGB features and registers you need to change byte 0143h in the cartridge header. Otherwise, the CGB will operate in monochrome "Non CGB" compatibility mode.

- Use a value of **80h** for games that support CGB and monochrome gameboys  
(with Lcc: **-Wm-yc**, or makebin directly: **-yc**)
- Use a value of **C0h** for CGB only games.  
(with Lcc: **-Wm-yC**, or makebin directly: **-yC**)

See the Pan Docs for more information CGB features.

### 18.22.2 Macro Definition Documentation

#### 18.22.2.1 RGB

```
#define RGB(
 r,
 g,
 b) (((UINT16)(b) & 0x1f) << 10) | (((UINT16)(g) & 0x1f) << 5) | (((UINT16)(r)
& 0x1f) << 0))
```

Macro to create a CGB palette color entry out of the color components.

**Parameters**

|          |                                              |
|----------|----------------------------------------------|
| <i>r</i> | Red Component, range 0 - 31 (31 brightest)   |
| <i>g</i> | Green Component, range 0 - 31 (31 brightest) |
| <i>b</i> | Blue Component, range 0 - 31 (31 brightest)  |

The resulting format is BGR 15bpp.

See also

```

**18.22.3 Function Documentation**

### 18.22.3.1 set\_bkg\_palette()

```
void set_bkg_palette (
 UINT8 first_palette,
 UINT8 nb_palettes,
 UINT16 * rgb_data)
```

Set CGB background palette(s).

#### Parameters

|                      |                                                                 |
|----------------------|-----------------------------------------------------------------|
| <i>first_palette</i> | Index of the first palette to write (0-7)                       |
| <i>nb_palettes</i>   | Number of palettes to write (1-8, max depends on first_palette) |
| <i>rgb_data</i>      | Pointer to source palette data                                  |

Writes **nb\_palettes** to background palette data starting at **first\_palette**, Palette data is sourced from **rgb\_data**.

- Each Palette is 8 bytes in size: 4 colors x 2 bytes per palette color entry.
- Each color (4 per palette) is packed as BGR 15bpp format (1:5:5:5, MSBit [15] is unused).
- Each component (R, G, B) may have values from 0 - 31 (5 bits), 31 is brightest.

#### See also

[RGB\(\)](#), [set\\_bkg\\_palette\\_entry\(\)](#)

### 18.22.3.2 set\_sprite\_palette()

```
void set_sprite_palette (
 UINT8 first_palette,
 UINT8 nb_palettes,
 UINT16 * rgb_data)
```

Set CGB sprite palette(s).

#### Parameters

|                      |                                                                 |
|----------------------|-----------------------------------------------------------------|
| <i>first_palette</i> | Index of the first palette to write (0-7)                       |
| <i>nb_palettes</i>   | Number of palettes to write (1-8, max depends on first_palette) |
| <i>rgb_data</i>      | Pointer to source palette data                                  |

Writes **nb\_palettes** to sprite palette data starting at **first\_palette**, Palette data is sourced from **rgb\_data**.

- Each Palette is 8 bytes in size: 4 colors x 2 bytes per palette color entry.
- Each color (4 per palette) is packed as BGR 15bpp format (1:5:5:5, MSBit [15] is unused).
- Each component (R, G, B) may have values from 0 - 31 (5 bits), 31 is brightest.

#### See also

[RGB\(\)](#), [set\\_sprite\\_palette\\_entry\(\)](#)

### 18.22.3.3 set\_bkg\_palette\_entry()

```
void set_bkg_palette_entry (
 UINT8 palette,
```

```

 UINT8 entry,
 UINT16 rgb_data)

```

Sets a single color in the specified CGB background palette.

#### Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>palette</i>  | Index of the palette to modify (0-7)      |
| <i>entry</i>    | Index of color in palette to modify (0-3) |
| <i>rgb_data</i> | New color data in BGR 15bpp format.       |

#### See also

[set\\_bkg\\_palette\(\)](#), [RGB\(\)](#)

#### 18.22.3.4 set\_sprite\_palette\_entry()

```

void set_sprite_palette_entry (
 UINT8 palette,
 UINT8 entry,
 UINT16 rgb_data)

```

Sets a single color in the specified CGB sprite palette.

#### Parameters

|                 |                                           |
|-----------------|-------------------------------------------|
| <i>palette</i>  | Index of the palette to modify (0-7)      |
| <i>entry</i>    | Index of color in palette to modify (0-3) |
| <i>rgb_data</i> | New color data in BGR 15bpp format.       |

#### See also

[set\\_sprite\\_palette\(\)](#), [RGB\(\)](#)

#### 18.22.3.5 cpu\_slow()

```

void cpu_slow (
 void)

```

Set CPU speed to slow (Normal Speed) operation.

Interrupts are temporarily disabled and then re-enabled during this call.

In this mode the CGB operates at the same speed as the DMG/Pocket/SGB models.

- You can check to see if `_cpu == CGB_TYPE` before using this function.

#### See also

[cpu\\_fast\(\)](#)

#### 18.22.3.6 cpu\_fast()

```

void cpu_fast (
 void)

```

Set CPU speed to fast (CGB Double Speed) operation.

On startup the CGB operates in Normal Speed Mode and can be switched into Double speed mode (faster processing but also higher power consumption). See the Pan Docs for more information about which hardware features operate faster and which remain at Normal Speed.

- Interrupts are temporarily disabled and then re-enabled during this call.
- You can check to see if `_cpu == CGB_TYPE` before using this function.

See also

`cpu_slow()`, `_cpu`

### 18.22.3.7 cgb\_compatibility()

```
void cgb_compatibility (
 void)
```

Set defaults compatible with the normal GameBoy models.

The default/first CGB palettes for sprites and backgrounds are set to a similar default appearance as on the DM↔G/Pocket/SGB models. (White, Light Gray, Dark Gray, Black)

- You can check to see if `_cpu == CGB_TYPE` before using this function.

## 18.23 gb/console.h File Reference

```
#include <types.h>
```

### Functions

- void `gotoxy` (`UINT8 x`, `UINT8 y`)
- `UINT8 posx` (void)
- `UINT8 posy` (void)
- void `setchar` (char `c`)
- void `cls` ()

### 18.23.1 Detailed Description

Console functions that work like Turbo C's.

The font is 8x8, making the screen 20x18 characters.

### 18.23.2 Function Documentation

#### 18.23.2.1 gotoxy()

```
void gotoxy (
 UINT8 x,
 UINT8 y)
```

Move the cursor to an absolute position at **x**, **y**.

**x** and **y** have units of tiles (8 pixels per unit)

See also

`setchar()`

### 18.23.2.2 posx()

```
UINT8 posx (
 void)
```

Returns the current X position of the cursor.

See also

[gotoxy\(\)](#)

### 18.23.2.3 posy()

```
UINT8 posy (
 void)
```

Returns the current Y position of the cursor.

See also

[gotoxy\(\)](#)

### 18.23.2.4 setchar()

```
void setchar (
 char c)
```

Writes out a single character at the current cursor position.

Does not update the cursor or interpret the character.

See also

[gotoxy\(\)](#)

### 18.23.2.5 cls()

```
void cls ()
```

Clears the screen

## 18.24 gb/crash\_handler.h File Reference

### Functions

- void [\\_\\_HandleCrash](#) ()

### 18.24.1 Detailed Description

When crash\_handler.h is included, a crash dump screen will be displayed if the CPU executes uninitialized memory (with a value of 0xFF, the opcode for RST 38). A handler is installed for RST 38 that calls [\\_\\_HandleCrash\(\)](#).

```
#include <gb/crash_handler.h>
```

Also see the `crash` example project included with gbdk.

### 18.24.2 Function Documentation

#### 18.24.2.1 \_\_HandleCrash()

```
void __HandleCrash ()
```

Display the crash dump screen.

See the intro for this file for more details.

## 18.25 gb/drawing.h File Reference

```
#include <types.h>
```

### 18.25.1 Detailed Description

All Points Addressable (APA) mode drawing library.

Drawing routines originally by Pascal Felber Legendary overhaul by Jon Fuge [jonny@q-continuum.demon.co.uk](mailto:jonny@q-continuum.demon.co.uk) Commenting by Michael Hope

Note: The standard text [printf\(\)](#) and [putchar\(\)](#) cannot be used in APA mode - use [gprintf\(\)](#) and [wrtchr\(\)](#) instead.

Note: Using drawing.h will cause it's custom VBL and LCD ISRs ([drawing\\_vbl](#) and [drawing\\_lcd](#)) to be installed.

---

#### Important note for the drawing API :

The Game Boy graphics hardware is not well suited to frame-buffer

style graphics such as the kind provided in [drawing.h](#). Due to that, **most drawing functions (rectangles, circles, etc) will be slow** . When possible it's much faster and more efficient to work with the tiles and tile maps that the Game Boy hardware is built around.

### 18.25.2 Macro Definition Documentation

### 18.25.2.1 GRAPHICS\_WIDTH

```
#define GRAPHICS_WIDTH 160
```

Size of the screen in pixels

### 18.25.2.2 GRAPHICS\_HEIGHT

```
#define GRAPHICS_HEIGHT 144
```

### 18.25.2.3 SOLID

```
#define SOLID 0x00 /* Overwrites the existing pixels */
```

Possible drawing modes

### 18.25.2.4 OR

```
#define OR 0x01 /* Performs a logical OR */
```

### 18.25.2.5 XOR

```
#define XOR 0x02 /* Performs a logical XOR */
```

### 18.25.2.6 AND

```
#define AND 0x03 /* Performs a logical AND */
```

### 18.25.2.7 WHITE

```
#define WHITE 0
```

Possible drawing colours

### 18.25.2.8 LTGREY

```
#define LTGREY 1
```

### 18.25.2.9 DKGREY

```
#define DKGREY 2
```

### 18.25.2.10 BLACK

```
#define BLACK 3
```

### 18.25.2.11 M\_NOFILL

```
#define M_NOFILL 0
```

Possible fill styles for [box\(\)](#) and [circle\(\)](#)

### 18.25.2.12 M\_FILL

```
#define M_FILL 1
```

### 18.25.2.13 SIGNED

```
#define SIGNED 1
```

Possible values for `signed_value` in [gprintln\(\)](#) and [gprntn\(\)](#)

### 18.25.2.14 UNSIGNED

```
#define UNSIGNED 0
```

## 18.25.3 Function Documentation

### 18.25.3.1 gprint()

```
void gprint (
 char * str)
```

Print the string '*str*' with no interpretation

See also

[gotogxy\(\)](#)

### 18.25.3.2 gprintln()

```
void gprintln (
 INT16 number,
 INT8 radix,
 INT8 signed_value)
```

Print 16 bit **number** in **radix** (base) in the default font at the current text position.

#### Parameters

|                     |                                                                                      |
|---------------------|--------------------------------------------------------------------------------------|
| <i>number</i>       | number to print                                                                      |
| <i>radix</i>        | radix (base) to print with                                                           |
| <i>signed_value</i> | should be set to SIGNED or UNSIGNED depending on whether the number is signed or not |

The current position is advanced by the number of characters printed.

See also

[gotogxy\(\)](#)

### 18.25.3.3 gprntn()

```
void gprntn (
 INT8 number,
 INT8 radix,
 INT8 signed_value)
```

Print 8 bit **number** in **radix** (base) in the default font at the current text position.

See also

[gprintln\(\)](#), [gotogxy\(\)](#)

### 18.25.3.4 gprintf()

```

INT8 gprintf (
 char * fmt,
 ...)

```

Print the string and arguments given by **fmt** with arguments \_\_\_\_

#### Parameters

|            |                                 |
|------------|---------------------------------|
| <i>fmt</i> | The format string as per printf |
| ...        | params                          |

Currently supported:

- %c (character)
- %u (int)
- %d (INT8)
- %o (INT8 as octal)
- %x (INT8 as hex)
- %s (string)

#### Returns

Returns the number of items printed, or -1 if there was an error.

See also

[gotogxy\(\)](#)

### 18.25.3.5 plot()

```

void plot (
 UINT8 x,
 UINT8 y,
 UINT8 colour,
 UINT8 mode)

```

Old style plot - try [plot\\_point\(\)](#)

### 18.25.3.6 plot\_point()

```

void plot_point (
 UINT8 x,
 UINT8 y)

```

Plot a point in the current drawing mode and colour at **x,y**

### 18.25.3.7 switch\_data()

```

void switch_data (
 UINT8 x,
 UINT8 y,
 unsigned char * src,
 unsigned char * dst)

```

Exchanges the tile on screen at x,y with the tile pointed by src, original tile is saved in dst. Both src and dst may be NULL - saving or copying to screen is not performed in this case.

### 18.25.3.8 draw\_image()

```
void draw_image (
 unsigned char * data)
```

Draw a full screen image at **data**

### 18.25.3.9 line()

```
void line (
 UINT8 x1,
 UINT8 y1,
 UINT8 x2,
 UINT8 y2)
```

Draw a line in the current drawing mode and colour from **x1,y1** to **x2,y2**

### 18.25.3.10 box()

```
void box (
 UINT8 x1,
 UINT8 y1,
 UINT8 x2,
 UINT8 y2,
 UINT8 style)
```

Draw a box (rectangle) with corners **x1,y1** and **x2,y2** using fill mode **style** (one of NOFILL or FILL)

### 18.25.3.11 circle()

```
void circle (
 UINT8 x,
 UINT8 y,
 UINT8 radius,
 UINT8 style)
```

Draw a circle with centre at **x,y** and **radius** using fill mode **style** (one of NOFILL or FILL)

### 18.25.3.12 getpix()

```
UINT8 getpix (
 UINT8 x,
 UINT8 y)
```

Returns the current colour of the pixel at **x,y**

### 18.25.3.13 wrtchr()

```
void wrtchr (
 char chr)
```

Prints the character **chr** in the default font at the current text position.  
The current position is advanced by 1 after the character is printed.

See also

[gotogxy\(\)](#)

### 18.25.3.14 gotogxy()

```
void gotogxy (
 UINT8 x,
 UINT8 y)
```

Sets the current text position to **x,y**.

Note: **x** and **y** have units of tiles (8 pixels per unit)

See also

[wrtchr\(\)](#)

### 18.25.3.15 color()

```
void color (
 UINT8 forecolor,
 UINT8 backcolor,
 UINT8 mode)
```

Set the current **foreground** colour (for pixels), **background** colour, and draw **mode**

## 18.26 gb/far\_ptr.h File Reference

### Data Structures

- union [\\_\\_far\\_ptr](#)

### Macros

- #define [TO\\_FAR\\_PTR](#)(ofs, seg) ((([FAR\\_PTR](#))seg << 16) | ([FAR\\_PTR](#))ofs)
- #define [FAR\\_SEG](#)(ptr) (((union [\\_\\_far\\_ptr](#) \*)&ptr)->segofs.seg)
- #define [FAR\\_OFS](#)(ptr) (((union [\\_\\_far\\_ptr](#) \*)&ptr)->segofs.ofs)
- #define [FAR\\_FUNC](#)(ptr, typ) ((typ)(((union [\\_\\_far\\_ptr](#) \*)&ptr)->segfn.fn))
- #define [FAR\\_CALL](#)(ptr, typ, ...) ( [\\_\\_call\\_banked\\_ptr](#)=ptr,((typ)& [\\_\\_call\\_banked](#))(\_\_VA\_ARGS\_\_)

### Typedefs

- typedef unsigned long [FAR\\_PTR](#)

### Functions

- void [\\_\\_call\\_banked](#) ()
- long [to\\_far\\_ptr](#) (void \*ofs, int seg)

### Variables

- volatile [FAR\\_PTR](#) [\\_\\_call\\_banked\\_ptr](#)
- volatile void \* [\\_\\_call\\_banked\\_addr](#)
- volatile unsigned char [\\_\\_call\\_banked\\_bank](#)

### 18.26.1 Detailed Description

Far pointers include a segment (bank) selector so they are able to point to addresses (functions or data) outside of the current bank (unlike normal pointers which are not bank-aware).

See the `banks_farptr` example project included with gbdk.

**Todo** Add link to a discussion about banking (such as, how to assign code and variables to banks)

### 18.26.2 Macro Definition Documentation

### 18.26.2.1 TO\_FAR\_PTR

```
#define TO_FAR_PTR(
 ofs,
 seg) (((FAR_PTR)seg << 16) | (FAR_PTR)ofs)
```

Macro to obtain a far pointer at compile-time

#### Parameters

|            |                                                |
|------------|------------------------------------------------|
| <i>ofs</i> | Memory address within the given Segment (Bank) |
| <i>seg</i> | Segment (Bank) number                          |

#### Returns

A far pointer (type [FAR\\_PTR](#))

### 18.26.2.2 FAR\_SEG

```
#define FAR_SEG(
 ptr) (((union __far_ptr *)&ptr)->segofs.seg)
```

Macro to get the Segment (Bank) number of a far pointer

#### Parameters

|            |                                               |
|------------|-----------------------------------------------|
| <i>ptr</i> | A far pointer (type <a href="#">FAR_PTR</a> ) |
|------------|-----------------------------------------------|

#### Returns

Segment (Bank) of the far pointer (type unsigned int)

### 18.26.2.3 FAR\_OFS

```
#define FAR_OFS(
 ptr) (((union __far_ptr *)&ptr)->segofs.ofs)
```

Macro to get the Offset (address) of a far pointer

#### Parameters

|            |                                               |
|------------|-----------------------------------------------|
| <i>ptr</i> | A far pointer (type <a href="#">FAR_PTR</a> ) |
|------------|-----------------------------------------------|

#### Returns

Offset (address) of the far pointer (type void \*)

### 18.26.2.4 FAR\_FUNC

```
#define FAR_FUNC(
 ptr,
 typ) ((typ) (((union __far_ptr *)&ptr)->segfn.fn))
```

### 18.26.2.5 FAR\_CALL

```
#define FAR_CALL(
 ptr,
 typ) ((typ) (((union __far_ptr *)&ptr)->segfn.fn))
```

```

 ptr,
 typ,
 ...) (__call_banked_ptr=ptr, ((typ) (&__call_banked)) (__VA_ARGS__))

```

Macro to call a function at far pointer **ptr** of type **typ**

#### Parameters

|            |                                                                   |
|------------|-------------------------------------------------------------------|
| <i>ptr</i> | Far pointer of a function to call (type <a href="#">FAR_PTR</a> ) |
| <i>typ</i> | Type to cast the function far pointer to.                         |
| ...        | VA Args list of parameters for the function                       |

**type** should match the definition of the function being called. For example:

```

// A function in bank 2
#pragma bank 2
int some_function(int param1, int param2) __banked { return 1; };
...
// Code elsewhere, such as unbanked main()
// This type declaration should match the above function
typedef int (*some_function_t)(int, int) __banked;
// Using FAR_CALL() with the above as *ptr*, *typ*, and two parameters.
result = FAR_CALL(some_function, some_function_t, 100, 50);

```

#### Returns

Value returned by the function (if present)

## 18.26.3 Typedef Documentation

### 18.26.3.1 FAR\_PTR

```
typedef unsigned long FAR_PTR
```

Type for storing a FAR\_PTR

## 18.26.4 Function Documentation

### 18.26.4.1 \_\_call\_banked()

```
void __call_banked ()
```

### 18.26.4.2 to\_far\_ptr()

```
long to_far_ptr (
 void * ofs,
 int seg)
```

Obtain a far pointer at runtime

#### Parameters

|            |                                                |
|------------|------------------------------------------------|
| <i>ofs</i> | Memory address within the given Segment (Bank) |
| <i>seg</i> | Segment (Bank) number                          |

### Returns

A far pointer (type [FAR\\_PTR](#))

## 18.26.5 Variable Documentation

### 18.26.5.1 `__call_banked_ptr`

```
volatile FAR_PTR __call_banked_ptr
```

### 18.26.5.2 `__call_banked_addr`

```
volatile void* __call_banked_addr
```

### 18.26.5.3 `__call_banked_bank`

```
volatile unsigned char __call_banked_bank
```

## 18.27 `gb/font.h` File Reference

```
#include <gb/gb.h>
```

## 18.27.1 Detailed Description

Multiple font support for the GameBoy Michael Hope, 1999 [michaelh@earthling.net](mailto:michaelh@earthling.net)

## 18.27.2 Macro Definition Documentation

### 18.27.2.1 FONT\_256ENCODING

```
#define FONT_256ENCODING 0
```

Various flags in the font header.

### 18.27.2.2 FONT\_128ENCODING

```
#define FONT_128ENCODING 1
```

### 18.27.2.3 FONT\_NOENCODING

```
#define FONT_NOENCODING 2
```

### 18.27.2.4 FONT\_COMPRESSED

```
#define FONT_COMPRESSED 4
```

## 18.27.3 Typedef Documentation

### 18.27.3.1 font\_t

```
typedef UINT16 font_t
```

font\_t is a handle to a font loaded by [font\\_load\(\)](#). It can be used with [font\\_set\(\)](#)

### 18.27.3.2 mfont\_handle

```
typedef struct sfont_handle mfont_handle
```

Internal representation of a font. What a font\_t really is

### 18.27.3.3 pmfont\_handle

```
typedef struct sfont_handle* pmfont_handle
```

## 18.27.4 Function Documentation

### 18.27.4.1 font\_init()

```
void font_init (
 void)
```

Initializes the font system. Should be called before other font functions.

### 18.27.4.2 font\_load()

```
font_t font_load (
 void * font)
```

Load a font and set it as the current font.

**Parameters**

|             |                                                 |
|-------------|-------------------------------------------------|
| <i>font</i> | Pointer to a font to load (usually a gbdk font) |
|-------------|-------------------------------------------------|

**Returns**

Handle to the loaded font, which can be used with [font\\_set\(\)](#)

**See also**

[font\\_init\(\)](#), [font\\_set\(\)](#), [List of gbdk fonts](#)

**18.27.4.3 font\_set()**

```
font_t font_set (
 font_t font_handle)
```

Set the current font.

**Parameters**

|                    |                                                          |
|--------------------|----------------------------------------------------------|
| <i>font_handle</i> | handle of a font returned by <a href="#">font_load()</a> |
|--------------------|----------------------------------------------------------|

**Returns**

The previously used font handle.

**See also**

[font\\_init\(\)](#), [font\\_load\(\)](#)

**18.28 gb/gb.h File Reference**

```
#include <types.h>
#include <gb/hardware.h>
#include <gb/sgb.h>
#include <gb/cgb.h>
```

### 18.28.1 Detailed Description

Gameboy specific functions.

## 18.28.2 Macro Definition Documentation

### 18.28.2.1 \_\_GBDK\_VERSION

```
#define __GBDK_VERSION 402
```

### 18.28.2.2 J\_START

```
#define J_START 0x80U
```

Joypad bits. A logical OR of these is used in the wait\_pad and joyypad functions. For example, to see if the B button is pressed try

```
UINT8 keys; keys = joyypad(); if (keys & J_B) { ... }
```

See also

[joyypad](#)

### 18.28.2.3 J\_SELECT

```
#define J_SELECT 0x40U
```

### 18.28.2.4 J\_B

```
#define J_B 0x20U
```

### 18.28.2.5 J\_A

```
#define J_A 0x10U
```

### 18.28.2.6 J\_DOWN

```
#define J_DOWN 0x08U
```

### 18.28.2.7 J\_UP

```
#define J_UP 0x04U
```

### 18.28.2.8 J\_LEFT

```
#define J_LEFT 0x02U
```

### 18.28.2.9 J\_RIGHT

```
#define J_RIGHT 0x01U
```

### 18.28.2.10 M\_DRAWING

```
#define M_DRAWING 0x01U
```

Screen modes. Normally used by internal functions only.

See also

[mode\(\)](#)

### 18.28.2.11 M\_TEXT\_OUT

```
#define M_TEXT_OUT 0x02U
```

### 18.28.2.12 M\_TEXT\_INOUT

```
#define M_TEXT_INOUT 0x03U
```

### 18.28.2.13 M\_NO\_SCROLL

```
#define M_NO_SCROLL 0x04U
```

Set this in addition to the others to disable scrolling

If scrolling is disabled, the cursor returns to (0,0)

See also

[mode\(\)](#)

### 18.28.2.14 M\_NO\_INTERP

```
#define M_NO_INTERP 0x08U
```

Set this to disable interpretation

See also

[mode\(\)](#)

### 18.28.2.15 S\_PALETTE

```
#define S_PALETTE 0x10U
```

If this is set, sprite colours come from OBJ1PAL. Else they come from OBJ0PAL

See also

[set\\_sprite\\_prop\(\)](#).

### 18.28.2.16 S\_FLIPX

```
#define S_FLIPX 0x20U
```

If set the sprite will be flipped horizontally.

See also

[set\\_sprite\\_prop\(\)](#)

#### 18.28.2.17 S\_FLIPY

```
#define S_FLIPY 0x40U
```

If set the sprite will be flipped vertically.

See also

[set\\_sprite\\_prop\(\)](#)

#### 18.28.2.18 S\_PRIORITY

```
#define S_PRIORITY 0x80U
```

If this bit is clear, then the sprite will be displayed on top of the background and window.

See also

[set\\_sprite\\_prop\(\)](#)

#### 18.28.2.19 VBL\_IFLAG

```
#define VBL_IFLAG 0x01U
```

VBlank Interrupt occurs at the start of the vertical blank.

During this period the video ram may be freely accessed.

See also

[set\\_interrupts\(\)](#),

[add\\_VBL](#)

#### 18.28.2.20 LCD\_IFLAG

```
#define LCD_IFLAG 0x02U
```

LCD Interrupt when triggered by the STAT register.

See also

[set\\_interrupts\(\)](#),

[add\\_LCD](#)

#### 18.28.2.21 TIM\_IFLAG

```
#define TIM_IFLAG 0x04U
```

Timer Interrupt when the timer [TIMA\\_REG](#) overflows.

See also

[set\\_interrupts\(\)](#),

[add\\_TIM](#)

#### 18.28.2.22 SIO\_IFLAG

```
#define SIO_IFLAG 0x08U
```

Serial Link Interrupt occurs when the serial transfer has completed.

See also

[set\\_interrupts\(\)](#),

[add\\_SIO](#)

### 18.28.2.23 JOY\_IFLAG

```
#define JOY_IFLAG 0x10U
```

Joyypad Interrupt occurs on a transition of the keypad.

See also

[set\\_interrupts\(\)](#),  
[add\\_JOY](#)

### 18.28.2.24 SCREENWIDTH

```
#define SCREENWIDTH 0xA0U
```

Width of the visible screen in pixels.

### 18.28.2.25 SCREENHEIGHT

```
#define SCREENHEIGHT 0x90U
```

Height of the visible screen in pixels.

### 18.28.2.26 MINWNDPOSX

```
#define MINWNDPOSX 0x07U
```

The Minimum X position of the Window Layer (Left edge of screen)

See also

[move\\_win\(\)](#)

### 18.28.2.27 MINWNDPOSY

```
#define MINWNDPOSY 0x00U
```

The Minimum Y position of the Window Layer (Top edge of screen)

See also

[move\\_win\(\)](#)

### 18.28.2.28 MAXWNDPOSX

```
#define MAXWNDPOSX 0xA6U
```

The Maximum X position of the Window Layer (Right edge of screen)

See also

[move\\_win\(\)](#)

### 18.28.2.29 MAXWNDPOSY

```
#define MAXWNDPOSY 0x8FU
```

The Maximum Y position of the Window Layer (Bottom edge of screen)

See also

[move\\_win\(\)](#)

### 18.28.2.30 DMG\_TYPE

```
#define DMG_TYPE 0x01
```

Hardware Model: Original GB or Super GB.

See also

[\\_cpu](#)

### 18.28.2.31 MGB\_TYPE

```
#define MGB_TYPE 0xFF
```

Hardware Model: Pocket GB or Super GB 2.

See also

[\\_cpu](#)

### 18.28.2.32 CGB\_TYPE

```
#define CGB_TYPE 0x11
```

Hardware Model: Color GB.

See also

[\\_cpu](#)

### 18.28.2.33 IO\_IDLE

```
#define IO_IDLE 0x00U
```

Serial Link IO is completed

### 18.28.2.34 IO\_SENDING

```
#define IO_SENDING 0x01U
```

Serial Link Sending data

### 18.28.2.35 IO\_RECEIVING

```
#define IO_RECEIVING 0x02U
```

Serial Link Receiving data

### 18.28.2.36 IO\_ERROR

```
#define IO_ERROR 0x04U
```

Serial Link Error

### 18.28.2.37 SWITCH\_ROM\_MBC1

```
#define SWITCH_ROM_MBC1(
```

```
 b) _current_bank = (b), *(unsigned char *)0x2000 = (b)
```

Makes MBC1 and other compatible MBCs switch the active ROM bank

Parameters

|          |                       |
|----------|-----------------------|
| <i>b</i> | ROM bank to switch to |
|----------|-----------------------|

**18.28.2.38 SWITCH\_RAM\_MBC1**

```
#define SWITCH_RAM_MBC1(
 b) *(unsigned char *)0x4000 = (b)
```

Switches SRAM bank on MBC1 and other compaticle MBCs

**Parameters**

|          |                        |
|----------|------------------------|
| <i>b</i> | SRAM bank to switch to |
|----------|------------------------|

**18.28.2.39 ENABLE\_RAM\_MBC1**

```
#define ENABLE_RAM_MBC1 *(unsigned char *)0x0000 = 0x0A
```

Enables SRAM on MBC1

**18.28.2.40 DISABLE\_RAM\_MBC1**

```
#define DISABLE_RAM_MBC1 *(unsigned char *)0x0000 = 0x00
```

Disables SRAM on MBC1

**18.28.2.41 SWITCH\_16\_8\_MODE\_MBC1**

```
#define SWITCH_16_8_MODE_MBC1 *(unsigned char *)0x6000 = 0x00
```

**18.28.2.42 SWITCH\_4\_32\_MODE\_MBC1**

```
#define SWITCH_4_32_MODE_MBC1 *(unsigned char *)0x6000 = 0x01
```

**18.28.2.43 SWITCH\_ROM\_MBC5**

```
#define SWITCH_ROM_MBC5(
 b)
```

**Value:**

```
 _current_bank = (b), \
 *(unsigned char *)0x3000 = 0, \
 *(unsigned char *)0x2000 = (b)
```

Makes MBC5 switch to the active ROM bank; only 4M roms are supported,

**See also**

[SWITCH\\_ROM\\_MBC5\\_8M\(\)](#)

**Parameters**

|          |                       |
|----------|-----------------------|
| <i>b</i> | ROM bank to switch to |
|----------|-----------------------|

Note the order used here. Writing the other way around on a MBC1 always selects bank 1

**18.28.2.44 SWITCH\_ROM\_MBC5\_8M**

```
#define SWITCH_ROM_MBC5_8M(
 b)
```

**Value:**

```
 *(unsigned char *)0x3000 = ((UINT16) (b) >> 8), \
 *(unsigned char *)0x2000 = (b)
```

Makes MBC5 to switch the active ROM bank; active bank number is not tracked by `_current_bank` if you use this macro

See also

[\\_current\\_bank](#)

Parameters

|          |                       |
|----------|-----------------------|
| <i>b</i> | ROM bank to switch to |
|----------|-----------------------|

Note the order used here. Writing the other way around on a MBC1 always selects bank 1

#### 18.28.2.45 SWITCH\_RAM\_MBC5

```
#define SWITCH_RAM_MBC5(
 b) *(unsigned char *)0x4000 = (b)
```

Switches SRAM bank on MBC5

Parameters

|          |                        |
|----------|------------------------|
| <i>b</i> | SRAM bank to switch to |
|----------|------------------------|

#### 18.28.2.46 ENABLE\_RAM\_MBC5

```
#define ENABLE_RAM_MBC5 *(unsigned char *)0x0000 = 0x0A
```

Enables SRAM on MBC5

#### 18.28.2.47 DISABLE\_RAM\_MBC5

```
#define DISABLE_RAM_MBC5 *(unsigned char *)0x0000 = 0x00
```

Disables SRAM on MBC5

#### 18.28.2.48 DISPLAY\_ON

```
#define DISPLAY_ON LCDC_REG|=0x80U
```

Turns the display back on.

See also

[display\\_off](#), [DISPLAY\\_OFF](#)

#### 18.28.2.49 DISPLAY\_OFF

```
#define DISPLAY_OFF display_off();
```

Turns the display off immediatly.

See also

[display\\_off](#), [DISPLAY\\_ON](#)

#### 18.28.2.50 SHOW\_BKG

```
#define SHOW_BKG LCDC_REG|=0x01U
```

Turns on the background layer. Sets bit 0 of the LCDC register to 1.

**18.28.2.51 HIDE\_BKG**

```
#define HIDE_BKG LCDC_REG&=0xFEU
```

Turns off the background layer. Sets bit 0 of the LCDC register to 0.

**18.28.2.52 SHOW\_WIN**

```
#define SHOW_WIN LCDC_REG|=0x20U
```

Turns on the window layer Sets bit 5 of the LCDC register to 1.

**18.28.2.53 HIDE\_WIN**

```
#define HIDE_WIN LCDC_REG&=0xDFU
```

Turns off the window layer. Clears bit 5 of the LCDC register to 0.

**18.28.2.54 SHOW\_SPRITES**

```
#define SHOW_SPRITES LCDC_REG|=0x02U
```

Turns on the sprites layer. Sets bit 1 of the LCDC register to 1.

**18.28.2.55 HIDE\_SPRITES**

```
#define HIDE_SPRITES LCDC_REG&=0xFDU
```

Turns off the sprites layer. Clears bit 1 of the LCDC register to 0.

**18.28.2.56 SPRITES\_8x16**

```
#define SPRITES_8x16 LCDC_REG|=0x04U
```

Sets sprite size to 8x16 pixels, two tiles one above the other. Sets bit 2 of the LCDC register to 1.

**18.28.2.57 SPRITES\_8x8**

```
#define SPRITES_8x8 LCDC_REG&=0xFBU
```

Sets sprite size to 8x8 pixels, one tile. Clears bit 2 of the LCDC register to 0.

**18.28.2.58 DISABLE\_OAM\_DMA**

```
#define DISABLE_OAM_DMA _shadow_OAM_base = 0
```

Disable OAM DMA copy each VBlank

**18.28.2.59 ENABLE\_OAM\_DMA**

```
#define ENABLE_OAM_DMA _shadow_OAM_base = (UBYTE)((UWORD)&shadow_OAM >> 8)
```

Enable OAM DMA copy each VBlank and set it to transfer default shadow\_OAM array

**18.28.3 Typedef Documentation****18.28.3.1 int\_handler**

```
typedef void(* int_handler) (void) NONBANKED
```

Interrupt handlers

**18.28.3.2 OAM\_item\_t**

```
typedef struct OAM_item_t OAM_item_t
```

Sprite Attributes structure

## Parameters

|             |                                                           |
|-------------|-----------------------------------------------------------|
| <i>x</i>    | X Coordinate of the sprite on screen                      |
| <i>y</i>    | Y Coordinate of the sprite on screen                      |
| <i>tile</i> | Sprite tile number (see <a href="#">set_sprite_tile</a> ) |
| <i>prop</i> | OAM Property Flags (see <a href="#">set_sprite_prop</a> ) |

## 18.28.4 Function Documentation

### 18.28.4.1 remove\_VBL()

```
void remove_VBL (
 int_handler h)
```

The remove functions will remove any interrupt handler.

A handler of NULL will cause bad things to happen if the given interrupt is enabled.

Removes the VBL interrupt handler.

See also

[add\\_VBL\(\)](#)

### 18.28.4.2 remove\_LCD()

```
void remove_LCD (
 int_handler h)
```

Removes the LCD interrupt handler.

See also

[add\\_LCD\(\)](#), [remove\\_VBL\(\)](#)

### 18.28.4.3 remove\_TIM()

```
void remove_TIM (
 int_handler h)
```

Removes the TIM interrupt handler.

See also

[add\\_TIM\(\)](#), [remove\\_VBL\(\)](#)

### 18.28.4.4 remove\_SIO()

```
void remove_SIO (
 int_handler h)
```

Removes the Serial Link / SIO interrupt handler.

See also

[add\\_SIO\(\)](#),  
[remove\\_VBL\(\)](#)

The default SIO ISR gets installed automatically if any of the standard SIO calls are used. These calls include [add\\_SIO\(\)](#), [remove\\_SIO\(\)](#), [send\\_byte\(\)](#), [receive\\_byte\(\)](#).

The default SIO ISR cannot be removed once installed. Only secondary chained SIO ISRs (added with [add\\_SIO\(\)](#)) can be removed.

**18.28.4.5 remove\_JOY()**

```
void remove_JOY (
 int_handler h)
```

Removes the JOY interrupt handler.

See also

[add\\_JOY\(\)](#), [remove\\_VBL\(\)](#)

**18.28.4.6 add\_VBL()**

```
void add_VBL (
 int_handler h)
```

Adds a V-blank interrupt handler.

Parameters

|          |                                                               |
|----------|---------------------------------------------------------------|
| <i>h</i> | The handler to be called whenever a V-blank interrupt occurs. |
|----------|---------------------------------------------------------------|

Up to 4 handlers may be added, with the last added being called last. If the [remove\\_VBL](#) function is to be called, only three may be added.

Note: The default VBL is installed automatically.

**18.28.4.7 add\_LCD()**

```
void add_LCD (
 int_handler h)
```

Adds a LCD interrupt handler.

Called when the LCD interrupt occurs, which is normally when [LY\\_REG](#) == [LYC\\_REG](#).

From pan/k0Pa: There are various reasons for this interrupt to occur as described by the [STAT\\_REG](#) register (\$FF41). One very popular reason is to indicate to the user when the video hardware is about to redraw a given LCD line. This can be useful for dynamically controlling the [SCX\\_REG](#) / [SCY\\_REG](#) registers (\$FF43/\$FF42) to perform special video effects.

See also

[add\\_VBL](#)

**18.28.4.8 add\_TIM()**

```
void add_TIM (
 int_handler h)
```

Adds a timer interrupt handler.

From pan/k0Pa: This interrupt occurs when the [TIMA\\_REG](#) register (\$FF05) changes from \$FF to \$00.

See also

[add\\_VBL](#)

[set\\_interrupts\(\)](#) with [TIM\\_IFLAG](#)

**18.28.4.9 add\_SIO()**

```
void add_SIO (
 int_handler h)
```

Adds a Serial Link transmit complete interrupt handler.

From pan/k0Pa: This interrupt occurs when a serial transfer has completed on the game link port.

See also

[send\\_byte](#), [receive\\_byte\(\)](#), [add\\_VBL\(\)](#)  
[set\\_interrupts\(\)](#) with [SIO\\_IFLAG](#)

#### 18.28.4.10 add\_JOY()

```
void add_JOY (
 int_handler h)
```

Adds a joystick button change interrupt handler.

From pan/k0Pa: This interrupt occurs on a transition of any of the keypad input lines from high to low. Due to the fact that keypad "bounce" is virtually always present, software should expect this interrupt to occur one or more times for every button press and one or more times for every button release.

See also

[joypad\(\)](#)

#### 18.28.4.11 nowait\_int\_handler()

```
void nowait_int_handler (
 void)
```

Interrupt handler chain terminator that does **not** wait for .STAT

You must add this handler last in every interrupt handler chain if you want to change the default interrupt handler behaviour that waits for LCD controller mode to become 1 or 0 before return from the interrupt.

Example:

```
__critical {
 add_SIO(nowait_int_handler); // Disable wait on VRAM state before returning from SIO interrupt
}
```

See also

[wait\\_int\\_handler\(\)](#)

#### 18.28.4.12 wait\_int\_handler()

```
void wait_int_handler (
 void)
```

Default Interrupt handler chain terminator that waits for

See also

[STAT\\_REG](#) and **only** returns at the BEGINNING of either Mode 0 or Mode 1.

Used by default at the end of interrupt chains to help prevent graphical glitches. The glitches are caused when an ISR interrupts a graphics operation in one mode but returns in a different mode for which that graphics operation is not allowed.

See also

[nowait\\_int\\_handler\(\)](#)

#### 18.28.4.13 mode()

```
void mode (
 UINT8 m)
```

Set the current screen mode - one of M\_\* modes

Normally used by internal functions only.

See also

[M\\_DRAWING](#), [M\\_TEXT\\_OUT](#), [M\\_TEXT\\_INOUT](#), [M\\_NO\\_SCROLL](#), [M\\_NO\\_INTERP](#)

#### 18.28.4.14 `get_mode()`

```
UINT8 get_mode (
 void)
```

Returns the current mode

#### 18.28.4.15 `send_byte()`

```
void send_byte (
 void)
```

Serial Link: Send the byte in [\\_io\\_out](#) out through the serial port

Make sure to enable interrupts for the Serial Link before trying to transfer data.

See also

[add\\_SIO\(\)](#), [remove\\_SIO\(\)](#)  
[set\\_interrupts\(\)](#) with [SIO\\_IFLAG](#)

#### 18.28.4.16 `receive_byte()`

```
void receive_byte (
 void)
```

Serial Link: Receive a byte from the serial port into [\\_io\\_in](#)

Make sure to enable interrupts for the Serial Link before trying to transfer data.

See also

[add\\_SIO\(\)](#), [remove\\_SIO\(\)](#)  
[set\\_interrupts\(\)](#) with [SIO\\_IFLAG](#)

#### 18.28.4.17 `delay()`

```
void delay (
 UINT16 d)
```

Delays the given number of milliseconds. Uses no timers or interrupts, and can be called with interrupts disabled (why nobody knows :)

#### 18.28.4.18 `joypad()`

```
UINT8 joypad (
 void)
```

Reads and returns the current state of the joypad. Follows Nintendo's guidelines for reading the pad. Return value is an OR of [J\\_\\*](#)

See also

[J\\_START](#), [J\\_SELECT](#), [J\\_A](#), [J\\_B](#), [J\\_UP](#), [J\\_DOWN](#), [J\\_LEFT](#), [J\\_RIGHT](#)

**18.28.4.19 waitpad()**

```
UINT8 waitpad (
 UINT8 mask)
```

Waits until at least one of the buttons given in mask are pressed.

**Parameters**

|             |                                              |
|-------------|----------------------------------------------|
| <i>mask</i> | Bitmask indicating which buttons to wait for |
|-------------|----------------------------------------------|

Normally only used for checking one key, but it will support many, even J\_LEFT at the same time as J\_RIGHT. :)  
 Note: Checks in a loop that doesn't HALT at all, so the CPU will be maxed out until this call returns.

**See also**

[joypad](#)

[J\\_START](#), [J\\_SELECT](#), [J\\_A](#), [J\\_B](#), [J\\_UP](#), [J\\_DOWN](#), [J\\_LEFT](#), [J\\_RIGHT](#)

**18.28.4.20 waitpadup()**

```
void waitpadup (
 void)
```

Waits for the directional pad and all buttons to be released.

Note: Checks in a loop that doesn't HALT at all, so the CPU will be maxed out until this call returns.

**18.28.4.21 joypad\_init()**

```
UINT8 joypad_init (
 UINT8 npads,
 joypads_t * joypads)
```

Initializes [joypads\\_t](#) structure for polling multiple joypads (for the GB and ones connected via SGB)

**Parameters**

|                |                                                                  |
|----------------|------------------------------------------------------------------|
| <i>npads</i>   | number of joypads requested (1, 2 or 4)                          |
| <i>joypads</i> | pointer to <a href="#">joypads_t</a> structure to be initialized |

Only required for [joypad\\_ex](#), not required for calls to regular [joypad\(\)](#)

**Returns**

number of joypads available

**See also**

[joypad\\_ex\(\)](#), [joypads\\_t](#)

**18.28.4.22 joypad\_ex()**

```
void joypad_ex (
 joypads_t * joypads)
```

Polls all available joypads (for the GB and ones connected via SGB)

**Parameters**

|                |                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>joypads</i> | pointer to <a href="#">joypads_t</a> structure to be filled with joypad statuses, must be previously initialized with <a href="#">joypad_init()</a> |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

See also

[joypad\\_init\(\)](#), [joypads\\_t](#)

#### 18.28.4.23 enable\_interrupts()

```
void enable_interrupts (
 void)
```

Enables unmasked interrupts

See also

[disable\\_interrupts](#), [set\\_interrupts](#)

#### 18.28.4.24 disable\_interrupts()

```
void disable_interrupts (
 void)
```

Disables interrupts.

This function may be called as many times as you like; however the first call to `enable_interrupts` will re-enable them.

See also

[enable\\_interrupts](#), [set\\_interrupts](#)

#### 18.28.4.25 set\_interrupts()

```
void set_interrupts (
 UINT8 flags)
```

Clears any pending interrupts and sets the interrupt mask register IO to flags.

Parameters

|              |                          |
|--------------|--------------------------|
| <i>flags</i> | A logical OR of *_IFLAGS |
|--------------|--------------------------|

See also

[enable\\_interrupts\(\)](#), [disable\\_interrupts\(\)](#)  
[VBL\\_IFLAG](#), [LCD\\_IFLAG](#), [TIM\\_IFLAG](#), [SIO\\_IFLAG](#), [JOY\\_IFLAG](#)

#### 18.28.4.26 reset()

```
void reset (
 void)
```

Performs a warm reset by reloading the CPU value then jumping to the start of crt0 (0x0150)

#### 18.28.4.27 wait\_vbl\_done()

```
void wait_vbl_done (
 void)
```

HALTs the CPU and waits for the vertical blank interrupt (VBL) to finish.

This is often used in main loops to idle the CPU at low power until it's time to start the next frame. It's also useful for syncing animation with the screen re-draw.

Warning: If the VBL interrupt is disabled, this function will never return. If the screen is off this function returns immediatly.

**18.28.4.28 display\_off()**

```
void display_off (
 void)
```

Turns the display off.

Waits until the VBL interrupt before turning the display off.

See also

[DISPLAY\\_ON](#)

**18.28.4.29 hiramcpy()**

```
void hiramcpy (
 UINT8 dst,
 const void * src,
 UINT8 n)
```

Copies data from somewhere in the lower address space to part of hi-ram.

**Parameters**

|            |                                                   |
|------------|---------------------------------------------------|
| <i>dst</i> | Offset in high ram (0xFF00 and above) to copy to. |
| <i>src</i> | Area to copy from                                 |
| <i>n</i>   | Number of bytes to copy.                          |

**18.28.4.30 set\_vram\_byte()**

```
void set_vram_byte (
 UBYTE * addr,
 UINT8 v)
```

Set byte in vram at given memory location

**Parameters**

|             |                     |
|-------------|---------------------|
| <i>addr</i> | address to write to |
| <i>v</i>    | value               |

**18.28.4.31 get\_bkg\_xy\_addr()**

```
UINT8* get_bkg_xy_addr (
 UINT8 x,
 UINT8 y)
```

Get address of X,Y tile of background map

**18.28.4.32 set\_bkg\_data()**

```
void set_bkg_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data)
```

Sets VRAM Tile Pattern data for the Background / Window

## Parameters

|                   |                                     |
|-------------------|-------------------------------------|
| <i>first_tile</i> | Index of the first tile to write    |
| <i>nb_tiles</i>   | Number of tiles to write            |
| <i>data</i>       | Pointer to (2 bpp) source tile data |

Writes **nb\_tiles** tiles to VRAM starting at **first\_tile**, tile data is sourced from **data**. Each Tile is 16 bytes in size (8x8 pixels, 2 bits-per-pixel).

Note: Sprite Tiles 128-255 share the same memory region as Background Tiles 128-255.

GBC only: [VBK\\_REG](#) determines which bank of Background tile patterns are written to.

- VBK\_REG=0 indicates the first bank
- VBK\_REG=1 indicates the second

#### 18.28.4.33 set\_bkg\_1bit\_data()

```
void set_bkg_1bit_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data,
 UINT8 color)
```

Sets VRAM Tile Pattern data for the Background / Window using 1bpp source data

## Parameters

|                   |                                            |
|-------------------|--------------------------------------------|
| <i>first_tile</i> | Index of the first Tile to write           |
| <i>nb_tiles</i>   | Number of Tiles to write                   |
| <i>data</i>       | Pointer to (1bpp) source Tile Pattern data |
| <i>color</i>      | Color                                      |

Similar to [set\\_bkg\\_data](#), except source data is 1 bit-per-pixel which gets expanded into 2 bits-per-pixel.

For a given bit that represent a pixel:

- 0 will be expanded into color 0
- 1 will be expanded into color 1, 2 or 3 depending on color argument

## See also

#### 18.28.4.34 get\_bkg\_data()

```
void get_bkg_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 unsigned char * data)
```

Copies from Background / Window VRAM Tile Pattern data into a buffer

## Parameters

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <i>first_tile</i> | Index of the first Tile to read from                |
| <i>nb_tiles</i>   | Number of Tiles to read                             |
| <i>data</i>       | Pointer to destination buffer for Tile Pattern data |

Copies **nb\_tiles** tiles from VRAM starting at **first\_tile**, Tile data is copied into **data**.  
Each Tile is 16 bytes, so the buffer pointed to by **data** should be at least **nb\_tiles** x 16 bytes in size.

See also

[get\\_win\\_data](#)

#### 18.28.4.35 set\_bkg\_tiles()

```
void set_bkg_tiles (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 const unsigned char * tiles)
```

Sets a rectangular region of Background Tile Map.

##### Parameters

|              |                                                                   |
|--------------|-------------------------------------------------------------------|
| <i>x</i>     | X Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>y</i>     | Y Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>w</i>     | Width of area to set in tiles. Range 1 - 32                       |
| <i>h</i>     | Height of area to set in tiles. Range 1 - 32                      |
| <i>tiles</i> | Pointer to source tile map data                                   |

Entries are copied from map at **tiles** to the Background Tile Map starting at **x**, **y** writing across for **w** tiles and down for **h** tiles.

Use [set\\_bkg\\_submap\(\)](#) instead when:

- Source map is wider than 32 tiles.
- Writing a width that does not match the source map width **and** more than one row high at a time.

One byte per source tile map entry.

Writes that exceed coordinate 31 on the x or y axis will wrap around to the Left and Top edges.

Note: Patterns 128-255 overlap with patterns 128-255 of the sprite Tile Pattern table.

GBC only: [VBK\\_REG](#) determines whether Tile Numbers or Tile Attributes get set.

- VBK\_REG=0 Tile Numbers are written
- VBK\_REG=1 Tile Attributes are written

GBC Tile Attributes are defined as:

- Bit 7 - Priority flag. When this is set, it puts the tile above the sprites with colour 0 being transparent.  
0: Below sprites  
1: Above sprites  
Note: [SHOW\\_BKG](#) needs to be set for these priorities to take place.
- Bit 6 - Vertical flip. Dictates which way up the tile is drawn vertically.  
0: Normal  
1: Flipped Vertically
- Bit 5 - Horizontal flip. Dictates which way up the tile is drawn horizontally.  
0: Normal  
1: Flipped Horizontally
- Bit 4 - Not used
- Bit 3 - Character Bank specification. Dictates from which bank of Background Tile Patterns the tile is taken.  
0: Bank 0  
1: Bank 1

- Bit 2 - See bit 0.
- Bit 1 - See bit 0.
- Bit 0 - Bits 0-2 indicate which of the 7 BKG colour palettes the tile is assigned.

See also

[SHOW\\_BKG](#)

[set\\_bkg\\_data](#), [set\\_bkg\\_submap](#)

#### 18.28.4.36 set\_bkg\_submap()

```
void set_bkg_submap (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 const unsigned char * map,
 UINT8 map_w)
```

Sets a rectangular area of the Background Tile Map using a sub-region from a source tile map. Useful for scrolling implementations of maps larger than 32 x 32 tiles.

##### Parameters

|                           |                                                                   |
|---------------------------|-------------------------------------------------------------------|
| <i>x</i>                  | X Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>y</i>                  | Y Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>w</i>                  | Width of area to set in tiles. Range 1 - 255                      |
| <i>h</i>                  | Height of area to set in tiles. Range 1 - 255                     |
| <i>map</i>                | Pointer to source tile map data                                   |
| <i>map</i> ↔<br><i>_w</i> | Width of source tile map in tiles. Range 1 - 255                  |

Entries are copied from **map** to the Background Tile Map starting at **x**, **y** writing across for **w** tiles and down for **h** tiles, using **map\_w** as the rowstride for the source tile map.

Use this instead of [set\\_bkg\\_tiles](#) when the source map is wider than 32 tiles or when writing a width that does not match the source map width.

One byte per source tile map entry.

Writes that exceed coordinate 31 on the x or y axis will wrap around to the Left and Top edges.

See [set\\_bkg\\_tiles](#) for setting CGB attribute maps with [VBK\\_REG](#).

See also

[SHOW\\_BKG](#)

[set\\_bkg\\_data](#), [set\\_bkg\\_tiles](#), [set\\_win\\_submap](#)

#### 18.28.4.37 get\_bkg\_tiles()

```
void get_bkg_tiles (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 unsigned char * tiles)
```

Copies a rectangular region of Background Tile Map entries into a buffer.

## Parameters

|              |                                                                   |
|--------------|-------------------------------------------------------------------|
| <i>x</i>     | X Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>y</i>     | Y Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>w</i>     | Width of area to copy in tiles. Range 0 - 31                      |
| <i>h</i>     | Height of area to copy in tiles. Range 0 - 31                     |
| <i>tiles</i> | Pointer to destination buffer for Tile Map data                   |

Entries are copied into **tiles** from the Background Tile Map starting at **x**, **y** reading across for **w** tiles and down for **h** tiles.

One byte per tile.

The buffer pointed to by **tiles** should be at least **x** x **y** bytes in size.

**18.28.4.38 set\_bkg\_tile\_xy()**

```
UINT8* set_bkg_tile_xy (
 UBYTE x,
 UBYTE y,
 UBYTE t)
```

Set single tile **t** on background layer at **x**,**y**

## Parameters

|          |              |
|----------|--------------|
| <i>x</i> | X-coordinate |
| <i>y</i> | Y-coordinate |
| <i>t</i> | tile index   |

## Returns

returns the address of tile, so you may use faster [set\\_vram\\_byte\(\)](#) later

**18.28.4.39 move\_bkg()**

```
void move_bkg (
 UINT8 x,
 UINT8 y) [inline]
```

Moves the Background Layer to the position specified in **x** and **y** in pixels.

## Parameters

|          |                                                          |
|----------|----------------------------------------------------------|
| <i>x</i> | X axis screen coordinate for Left edge of the Background |
| <i>y</i> | Y axis screen coordinate for Top edge of the Background  |

0,0 is the top left corner of the GB screen. The Background Layer wraps around the screen, so when part of it goes off the screen it appears on the opposite side (factoring in the larger size of the Background Layer versus the screen size).

The background layer is always under the Window Layer.

See also

[SHOW\\_BKG](#), [HIDE\\_BKG](#)

**18.28.4.40 scroll\_bkg()**

```
void scroll_bkg (
```

```

 INT8 x,
 INT8 y) [inline]

```

Moves the Background relative to it's current position.

#### Parameters

|          |                                                                                   |
|----------|-----------------------------------------------------------------------------------|
| <i>x</i> | Number of pixels to move the Background on the <b>X axis</b><br>Range: -128 - 127 |
| <i>y</i> | Number of pixels to move the Background on the <b>Y axis</b><br>Range: -128 - 127 |

#### See also

[move\\_bkg](#)

#### 18.28.4.41 `get_win_xy_addr()`

```

UINT8* get_win_xy_addr (
 UINT8 x,
 UINT8 y)

```

Get address of X,Y tile of window map

#### 18.28.4.42 `set_win_data()`

```

void set_win_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data)

```

Sets VRAM Tile Pattern data for the Window / Background

#### Parameters

|                   |                                              |
|-------------------|----------------------------------------------|
| <i>first_tile</i> | Index of the first tile to write             |
| <i>nb_tiles</i>   | Number of tiles to write                     |
| <i>data</i>       | Pointer to (2 bpp) source Tile Pattern data. |

This is the same as [set\\_bkg\\_data](#), since the Window Layer and Background Layer share the same Tile pattern data.

#### See also

```

void set_win_1bit_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data)

```

Sets VRAM Tile Pattern data for the Window / Background using 1bpp source data

#### Parameters

|                   |                                  |
|-------------------|----------------------------------|
| <i>first_tile</i> | Index of the first tile to write |
|-------------------|----------------------------------|

## Parameters

|                 |                                            |
|-----------------|--------------------------------------------|
| <i>nb_tiles</i> | Number of tiles to write                   |
| <i>data</i>     | Pointer to (1bpp) source Tile Pattern data |

This is the same as [set\\_bkg\\_1bit\\_data](#), since the Window Layer and Background Layer share the same Tile pattern data.

## See also

[set\\_bkg\\_data](#), [set\\_bkg\\_1bit\\_data](#), [set\\_win\\_data](#)

**18.28.4.44 get\_win\_data()**

```
void get_win_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 unsigned char * data)
```

Copies from Window / Background VRAM Tile Pattern data into a buffer

## Parameters

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <i>first_tile</i> | Index of the first Tile to read from                |
| <i>nb_tiles</i>   | Number of Tiles to read                             |
| <i>data</i>       | Pointer to destination buffer for Tile Pattern Data |

This is the same as [get\\_bkg\\_data](#), since the Window Layer and Background Layer share the same Tile pattern data.

## See also

[get\\_bkg\\_data](#)

**18.28.4.45 set\_win\_tiles()**

```
void set_win_tiles (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 const unsigned char * tiles)
```

Sets a rectangular region of the Window Tile Map.

## Parameters

|              |                                                               |
|--------------|---------------------------------------------------------------|
| <i>x</i>     | X Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>y</i>     | Y Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>w</i>     | Width of area to set in tiles. Range 1 - 32                   |
| <i>h</i>     | Height of area to set in tiles. Range 1 - 32                  |
| <i>tiles</i> | Pointer to source tile map data                               |

Entries are copied from map at **tiles** to the Window Tile Map starting at **x**, **y** writing across for **w** tiles and down for **h** tiles.

Use [set\\_win\\_submap\(\)](#) instead when:

- Source map is wider than 32 tiles.

- Writing a width that does not match the source map width **and** more than one row high at a time.

One byte per source tile map entry.

Writes that exceed coordinate 31 on the x or y axis will wrap around to the Left and Top edges.

Note: Patterns 128-255 overlap with patterns 128-255 of the sprite Tile Pattern table.

GBC only: [VBK\\_REG](#) determines whether Tile Numbers or Tile Attributes get set.

- `VBK_REG=0` Tile Numbers are written
- `VBK_REG=1` Tile Attributes are written

For more details about GBC Tile Attributes see [set\\_bkg\\_tiles](#).

See also

[SHOW\\_WIN](#), [HIDE\\_WIN](#), [set\\_win\\_submap](#), [set\\_bkg\\_tiles](#), [set\\_bkg\\_data](#)

#### 18.28.4.46 set\_win\_submap()

```
void set_win_submap (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 const unsigned char * map,
 UINT8 map_w)
```

Sets a rectangular area of the Window Tile Map using a sub-region from a source tile map.

##### Parameters

|              |                                                               |
|--------------|---------------------------------------------------------------|
| <i>x</i>     | X Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>y</i>     | Y Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>w</i>     | Width of area to set in tiles. Range 1 - 255                  |
| <i>h</i>     | Height of area to set in tiles. Range 1 - 255                 |
| <i>map</i>   | Pointer to source tile map data                               |
| <i>map_w</i> | Width of source tile map in tiles. Range 1 - 255              |

Entries are copied from **map** to the Window Tile Map starting at **x**, **y** writing across for **w** tiles and down for **h** tiles, using **map\_w** as the rowstride for the source tile map.

Use this instead of [set\\_win\\_tiles](#) when the source map is wider than 32 tiles or when writing a width that does not match the source map width.

One byte per source tile map entry.

Writes that exceed coordinate 31 on the x or y axis will wrap around to the Left and Top edges.

GBC only: [VBK\\_REG](#) determines whether Tile Numbers or Tile Attributes get set.

- `VBK_REG=0` Tile Numbers are written
- `VBK_REG=1` Tile Attributes are written

See [set\\_bkg\\_tiles](#) for details about CGB attribute maps with [VBK\\_REG](#).

#### 18.28.4.47 get\_win\_tiles()

```
void get_win_tiles (
 UINT8 x,
```

```

 UINT8 y,
 UINT8 w,
 UINT8 h,
 unsigned char * tiles)

```

Copies a rectangular region of Window Tile Map entries into a buffer.

#### Parameters

|              |                                                               |
|--------------|---------------------------------------------------------------|
| <i>x</i>     | X Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>y</i>     | Y Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>w</i>     | Width of area to copy in tiles. Range 0 - 31                  |
| <i>h</i>     | Height of area to copy in tiles. Range 0 - 31                 |
| <i>tiles</i> | Pointer to destination buffer for Tile Map data               |

Entries are copied into **tiles** from the Window Tile Map starting at **x**, **y** reading across for **w** tiles and down for **h** tiles.

One byte per tile.

The buffer pointed to by **tiles** should be at least **x** x **y** bytes in size.

#### 18.28.4.48 set\_win\_tile\_xy()

```

UINT8* set_win_tile_xy (
 UBYTE x,
 UBYTE y,
 UBYTE t)

```

Set single tile **t** on window layer at **x**,**y**

#### Parameters

|          |              |
|----------|--------------|
| <i>x</i> | X-coordinate |
| <i>y</i> | Y-coordinate |
| <i>t</i> | tile index   |

#### Returns

returns the address of tile, so you may use faster [set\\_vram\\_byte\(\)](#) later

#### 18.28.4.49 move\_win()

```

void move_win (
 UINT8 x,
 UINT8 y) [inline]

```

Moves the Window to the **x**, **y** position on the screen.

#### Parameters

|          |                                                                                    |
|----------|------------------------------------------------------------------------------------|
| <i>x</i> | X coordinate for Left edge of the Window (actual displayed location will be X - 7) |
| <i>y</i> | Y coordinate for Top edge of the Window                                            |

7,0 is the top left corner of the screen in Window coordinates. The Window is locked to the bottom right corner. The Window is always over the Background layer.

See also

[SHOW\\_WIN](#), [HIDE\\_WIN](#)

#### 18.28.4.50 scroll\_win()

```
void scroll_win (
 INT8 x,
 INT8 y) [inline]
```

Move the Window relative to its current position.

Parameters

|          |                                                                               |
|----------|-------------------------------------------------------------------------------|
| <i>x</i> | Number of pixels to move the window on the <b>X axis</b><br>Range: -128 - 127 |
| <i>y</i> | Number of pixels to move the window on the <b>Y axis</b><br>Range: -128 - 127 |

[move\\_win](#)

#### 18.28.4.51 set\_sprite\_data()

```
void set_sprite_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data)
```

Sets VRAM Tile Pattern data for Sprites

Parameters

|                   |                                             |
|-------------------|---------------------------------------------|
| <i>first_tile</i> | Index of the first tile to write            |
| <i>nb_tiles</i>   | Number of tiles to write                    |
| <i>data</i>       | Pointer to (2 bpp) source Tile Pattern data |

Writes **nb\_tiles** tiles to VRAM starting at **first\_tile**, tile data is sourced from **data**. Each Tile is 16 bytes in size (8x8 pixels, 2 bits-per-pixel).

Note: Sprite Tiles 128-255 share the same memory region as Background Tiles 128-255.

GBC only: [VBK\\_REG](#) determines which bank of Background tile patterns are written to.

- VBK\_REG=0 indicates the first bank
- VBK\_REG=1 indicates the second

#### 18.28.4.52 set\_sprite\_1bit\_data()

```
void set_sprite_1bit_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 const unsigned char * data)
```

Sets VRAM Tile Pattern data for Sprites using 1bpp source data

## Parameters

|                   |                                            |
|-------------------|--------------------------------------------|
| <i>first_tile</i> | Index of the first tile to write           |
| <i>nb_tiles</i>   | Number of tiles to write                   |
| <i>data</i>       | Pointer to (1bpp) source Tile Pattern data |

Similar to [set\\_sprite\\_data](#), except source data is 1 bit-per-pixel which gets expanded into 2 bits-per-pixel.  
For a given bit that represent a pixel:

- 0 will be expanded into color 0
- 1 will be expanded into color 3

**18.28.4.53 get\_sprite\_data()**

```
void get_sprite_data (
 UINT8 first_tile,
 UINT8 nb_tiles,
 unsigned char * data)
```

Copies from Sprite VRAM Tile Pattern data into a buffer

## Parameters

|                   |                                                     |
|-------------------|-----------------------------------------------------|
| <i>first_tile</i> | Index of the first tile to read from                |
| <i>nb_tiles</i>   | Number of tiles to read                             |
| <i>data</i>       | Pointer to destination buffer for Tile Pattern data |

Copies **nb\_tiles** tiles from VRAM starting at **first\_tile**, tile data is copied into **data**.  
Each Tile is 16 bytes, so the buffer pointed to by **data** should be at least **nb\_tiles** x 16 bytes in size.

**18.28.4.54 SET\_SHADOW\_OAM\_ADDRESS()**

```
void SET_SHADOW_OAM_ADDRESS (
 void * address) [inline]
```

Enable OAM DMA copy each VBlank and set it to transfer any 256-byte aligned array

**18.28.4.55 set\_sprite\_tile()**

```
void set_sprite_tile (
 UINT8 nb,
 UINT8 tile) [inline]
```

Sets sprite number **nb** in the OAM to display tile number **\_\_tile**.

## Parameters

|             |                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>nb</i>   | Sprite number, range 0 - 39                                                                                                                                                                        |
| <i>tile</i> | Selects a tile (0 - 255) from memory at 8000h - 8FFFh<br>In CGB Mode this could be either in VRAM Bank 0 or 1, depending on Bit 3 of the OAM Attribute Flag (see <a href="#">set_sprite_prop</a> ) |

In 8x16 mode:

- The sprite will also display the next tile (**tile** + 1) directly below (y + 8) the first tile.
- The lower bit of the tile number is ignored: the upper 8x8 tile is (**tile** & 0xFE), and the lower 8x8 tile is (**tile** | 0x01).
- See: [SPRITES\\_8x16](#)

#### 18.28.4.56 get\_sprite\_tile()

```
UINT8 get_sprite_tile (
 UINT8 nb) [inline]
```

Returns the tile number of sprite number **nb** in the OAM.

##### Parameters

|           |                             |
|-----------|-----------------------------|
| <i>nb</i> | Sprite number, range 0 - 39 |
|-----------|-----------------------------|

##### See also

[set\\_sprite\\_tile](#) for more details

#### 18.28.4.57 set\_sprite\_prop()

```
void set_sprite_prop (
 UINT8 nb,
 UINT8 prop) [inline]
```

Sets the OAM Property Flags of sprite number **nb** to those defined in **prop**.

##### Parameters

|             |                                             |
|-------------|---------------------------------------------|
| <i>nb</i>   | Sprite number, range 0 - 39                 |
| <i>prop</i> | Property setting (see bitfield description) |

The bits in **prop** represent:

- Bit 7 - Priority flag. When this is set the sprites appear behind the background and window layer.  
0: in front  
1: behind
- Bit 6 - Vertical flip. Dictates which way up the sprite is drawn vertically.  
0: normal  
1: upside down
- Bit 5 - Horizontal flip. Dictates which way up the sprite is drawn horizontally.  
0: normal  
1: back to front
- Bit 4 - DMG/Non-CGB Mode Only. Assigns either one of the two b/w palettes to the sprite.  
0: OBJ palette 0  
1: OBJ palette 1
- Bit 3 - GBC only. Dictates from which bank of Sprite Tile Patterns the tile is taken.  
0: Bank 0  
1: Bank 1
- Bit 2 - See bit 0.
- Bit 1 - See bit 0.

- Bit 0 - GBC only. Bits 0-2 indicate which of the 7 OBJ colour palettes the sprite is assigned.

#### 18.28.4.58 get\_sprite\_prop()

```
UINT8 get_sprite_prop (
 UINT8 nb) [inline]
```

Returns the OAM Property Flags of sprite number **nb**.

##### Parameters

|           |                             |
|-----------|-----------------------------|
| <i>nb</i> | Sprite number, range 0 - 39 |
|-----------|-----------------------------|

##### See also

[set\\_sprite\\_prop](#) for property bitfield settings

#### 18.28.4.59 move\_sprite()

```
void move_sprite (
 UINT8 nb,
 UINT8 x,
 UINT8 y) [inline]
```

Moves sprite number **nb** to the **x**, **y** position on the screen.

##### Parameters

|           |                                                                                                                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>nb</i> | Sprite number, range 0 - 39                                                                                                                                                                                                                                     |
| <i>x</i>  | X Position. Specifies the sprites horizontal position on the screen (minus 8).<br>An offscreen value (X=0 or X>=168) hides the sprite, but the sprite still affects the priority ordering - a better way to hide a sprite is to set its Y-coordinate offscreen. |
| <i>y</i>  | Y Position. Specifies the sprites vertical position on the screen (minus 16).<br>An offscreen value (for example, Y=0 or Y>=160) hides the sprite.                                                                                                              |

Moving the sprite to 0,0 (or similar off-screen location) will hide it.

#### 18.28.4.60 scroll\_sprite()

```
void scroll_sprite (
 UINT8 nb,
 INT8 x,
 INT8 y) [inline]
```

Moves sprite number **nb** relative to its current position.

##### Parameters

|           |                                                                               |
|-----------|-------------------------------------------------------------------------------|
| <i>nb</i> | Sprite number, range 0 - 39                                                   |
| <i>x</i>  | Number of pixels to move the sprite on the <b>X axis</b><br>Range: -128 - 127 |
| <i>y</i>  | Number of pixels to move the sprite on the <b>Y axis</b><br>Range: -128 - 127 |

See also

[move\\_sprite](#) for more details about the X and Y position

#### 18.28.4.61 hide\_sprite()

```
void hide_sprite (
 UINT8 nb) [inline]
```

Hides sprite number **nb** by moving it to zero position by Y.

Parameters

|           |                             |
|-----------|-----------------------------|
| <i>nb</i> | Sprite number, range 0 - 39 |
|-----------|-----------------------------|

#### 18.28.4.62 set\_data()

```
void set_data (
 unsigned char * vram_addr,
 const unsigned char * data,
 UINT16 len)
```

Copies Tile Pattern data to an address in VRAM

Parameters

|                  |                                     |
|------------------|-------------------------------------|
| <i>vram_addr</i> | Pointer to destination VRAM Address |
| <i>data</i>      | Pointer to source buffer            |
| <i>len</i>       | Number of bytes to copy             |

Copies **len** bytes from a buffer at **data** to VRAM starting at **vram\_addr**.

GBC only: [VBK\\_REG](#) determines which bank of Background tile patterns are written to.

- VBK\_REG=0 indicates the first bank
- VBK\_REG=1 indicates the second

#### 18.28.4.63 get\_data()

```
void get_data (
 unsigned char * data,
 unsigned char * vram_addr,
 UINT16 len)
```

Copies Tile Pattern data from an address in VRAM into a buffer

Parameters

|                  |                                |
|------------------|--------------------------------|
| <i>vram_addr</i> | Pointer to source VRAM Address |
| <i>data</i>      | Pointer to destination buffer  |
| <i>len</i>       | Number of bytes to copy        |

Copies **len** bytes from VRAM starting at **vram\_addr** into a buffer at **data**.

GBC only: [VBK\\_REG](#) determines which bank of Background tile patterns are written to.

- VBK\_REG=0 indicates the first bank

- VBK\_REG=1 indicates the second

#### 18.28.4.64 set\_tiles()

```
void set_tiles (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 unsigned char * vram_addr,
 const unsigned char * tiles)
```

Sets a rectangular region of Tile Map entries at a given VRAM Address.

##### Parameters

|                  |                                                        |
|------------------|--------------------------------------------------------|
| <i>x</i>         | X Start position in Map tile coordinates. Range 0 - 31 |
| <i>y</i>         | Y Start position in Map tile coordinates. Range 0 - 31 |
| <i>w</i>         | Width of area to set in tiles. Range 1 - 32            |
| <i>h</i>         | Height of area to set in tiles. Range 1 - 32           |
| <i>vram_addr</i> | Pointer to destination VRAM Address                    |
| <i>tiles</i>     | Pointer to source Tile Map data                        |

Entries are copied from **tiles** to Tile Map at address *vram\_addr* starting at **x**, **y** writing across for **w** tiles and down for **h** tiles.

One byte per source tile map entry.

There are two 32x32 Tile Maps in VRAM at addresses 9800h-9BFFh and 9C00h-9FFFh.

GBC only: **VBK\_REG** determines whether Tile Numbers or Tile Attributes get set.

- VBK\_REG=0 Tile Numbers are written
- VBK\_REG=1 Tile Attributes are written

#### 18.28.4.65 get\_tiles()

```
void get_tiles (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 unsigned char * tiles,
 unsigned char * vram_addr)
```

Copies a rectangular region of Tile Map entries from a given VRAM Address into a buffer.

##### Parameters

|                  |                                                                   |
|------------------|-------------------------------------------------------------------|
| <i>x</i>         | X Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>y</i>         | Y Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>w</i>         | Width of area to copy in tiles. Range 0 - 31                      |
| <i>h</i>         | Height of area to copy in tiles. Range 0 - 31                     |
| <i>tiles</i>     | Pointer to destination buffer for Tile Map data                   |
| <i>vram_addr</i> | Pointer to source VRAM Address                                    |

Entries are copied into **tiles** from the Background Tile Map starting at **x**, **y** reading across for **w** tiles and down for **h**

tiles.

One byte per tile.

There are two 32x32 Tile Maps in VRAM at addresses 9800h - 9BFFh and 9C00h - 9FFFh.

The buffer pointed to by **tiles** should be at least **x** x **y** bytes in size.

#### 18.28.4.66 init\_win()

```
void init_win (
 UINT8 c)
```

Initializes the entire Window Tile Map with Tile Number **c**

##### Parameters

|          |                          |
|----------|--------------------------|
| <b>c</b> | Tile number to fill with |
|----------|--------------------------|

Note: This function avoids writes during modes 2 & 3

#### 18.28.4.67 init\_bkg()

```
void init_bkg (
 UINT8 c)
```

Initializes the entire Background Tile Map with Tile Number **c**

##### Parameters

|          |                          |
|----------|--------------------------|
| <b>c</b> | Tile number to fill with |
|----------|--------------------------|

Note: This function avoids writes during modes 2 & 3

#### 18.28.4.68 vmemset()

```
void vmemset (
 void * s,
 UINT8 c,
 size_t n)
```

Fills the VRAM memory region **s** of size **n** with Tile Number **c**

##### Parameters

|          |                                          |
|----------|------------------------------------------|
| <b>s</b> | Start address in VRAM                    |
| <b>c</b> | Tile number to fill with                 |
| <b>n</b> | Size of memory region (in bytes) to fill |

Note: This function avoids writes during modes 2 & 3

#### 18.28.4.69 fill\_bkg\_rect()

```
void fill_bkg_rect (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 UINT8 tile)
```

Fills a rectangular region of Tile Map entries for the Background layer with tile.

##### Parameters

|          |                                                                   |
|----------|-------------------------------------------------------------------|
| <b>x</b> | X Start position in Background Map tile coordinates. Range 0 - 31 |
|----------|-------------------------------------------------------------------|

## Parameters

|             |                                                                   |
|-------------|-------------------------------------------------------------------|
| <i>y</i>    | Y Start position in Background Map tile coordinates. Range 0 - 31 |
| <i>w</i>    | Width of area to set in tiles. Range 0 - 31                       |
| <i>h</i>    | Height of area to set in tiles. Range 0 - 31                      |
| <i>tile</i> | Fill value                                                        |

**18.28.4.70 fill\_win\_rect()**

```
void fill_win_rect (
 UINT8 x,
 UINT8 y,
 UINT8 w,
 UINT8 h,
 UINT8 tile)
```

Fills a rectangular region of Tile Map entries for the Window layer with tile.

## Parameters

|             |                                                               |
|-------------|---------------------------------------------------------------|
| <i>x</i>    | X Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>y</i>    | Y Start position in Window Map tile coordinates. Range 0 - 31 |
| <i>w</i>    | Width of area to set in tiles. Range 0 - 31                   |
| <i>h</i>    | Height of area to set in tiles. Range 0 - 31                  |
| <i>tile</i> | Fill value                                                    |

**18.28.5 Variable Documentation****18.28.5.1 c**

```
int c
```

**18.28.5.2 \_cpu**

```
UINT8 _cpu
```

GB CPU type

- void [gb\\_decompress\\_sprite\\_data](#) (UINT8 first\_tile, const unsigned char \*sour) \_\_preserves\_regs(b

### Variables

- void [c](#)

### 18.29.1 Function Documentation

#### 18.29.1.1 gb\_decompress()

```
void gb_decompress (
 const unsigned char * sour,
 unsigned char * dest)
```

gb-decompress data from sour into dest

##### Parameters

|             |                                       |
|-------------|---------------------------------------|
| <i>sour</i> | Pointer to source gb-compressed data  |
| <i>dest</i> | Pointer to destination buffer/address |

##### See also

[gb\\_decompress\\_bkg\\_data](#), [gb\\_decompress\\_win\\_data](#), [gb\\_decompress\\_sprite\\_data](#)

#### 18.29.1.2 gb\_decompress\_bkg\_data()

```
void gb_decompress_bkg_data (
 UINT8 first_tile,
 const unsigned char * sour)
```

gb-decompress background tiles into VRAM

##### Parameters

|                   |                                                            |
|-------------------|------------------------------------------------------------|
| <i>first_tile</i> | Index of the first tile to write                           |
| <i>sour</i>       | Pointer to (gb-compressed 2 bpp) source Tile Pattern data. |

Note: This function avoids writes during modes 2 & 3

##### See also

[gb\\_decompress\\_bkg](#), [gb\\_decompress\\_win\\_data](#), [gb\\_decompress\\_sprite\\_data](#)

#### 18.29.1.3 gb\_decompress\_win\_data()

```
void gb_decompress_win_data (
 UINT8 first_tile,
 const unsigned char * sour)
```

gb-decompress window tiles into VRAM

#### Parameters

|                   |                                                            |
|-------------------|------------------------------------------------------------|
| <i>first_tile</i> | Index of the first tile to write                           |
| <i>sour</i>       | Pointer to (gb-compressed 2 bpp) source Tile Pattern data. |

This is the same as [gb\\_decompress\\_bkg\\_data](#), since the Window Layer and Background Layer share the same Tile pattern data.

Note: This function avoids writes during modes 2 & 3

#### See also

[gb\\_decompress](#), [gb\\_decompress\\_bkg\\_data](#), [gb\\_decompress\\_sprite\\_data](#)

### 18.29.1.4 gb\_decompress\_sprite\_data()

```
void gb_decompress_sprite_data (
 UINT8 first_tile,
 const unsigned char * sour)
```

gb-decompress sprite tiles into VRAM

#### Parameters

|                   |                                   |
|-------------------|-----------------------------------|
| <i>first_tile</i> | Index of the first tile to write  |
| <i>sour</i>       | Pointer to source compressed data |

Note: This function avoids writes during modes 2 & 3

#### See also

### 18.31.1 Detailed Description

Header for a simple implementation of [malloc\(\)](#).

**Todo** : This library may currently be broken.

### 18.31.2 Macro Definition Documentation

#### 18.31.2.1 MALLOC\_FREE

```
#define MALLOC_FREE 1
```

The malloc hunk flags Note: Could have used a negative size a'la TI

#### 18.31.2.2 MALLOC\_USED

```
#define MALLOC_USED 2
```

#### 18.31.2.3 MALLOC\_MAGIC

```
#define MALLOC_MAGIC 123
```

Magic number of a header. Gives us some chance of surviving if the list is corrupted

### 18.31.3 Typedef Documentation

#### 18.31.3.1 mmalloc\_hunk

```
typedef struct smalloc_hunk mmalloc_hunk
```

#### 18.31.3.2 pmmalloc\_hunk

```
typedef struct smalloc_hunk* pmmalloc_hunk
```

### 18.31.4 Function Documentation

#### 18.31.4.1 malloc\_gc()

```
void malloc_gc (
 void)
Garbage collect (join free hunks)
```

#### 18.31.4.2 debug()

```
void debug (
 char * routine,
 char * msg)
debug message logger
```

### 18.31.5 Variable Documentation

#### 18.31.5.1 malloc\_heap\_start

`UBYTE malloc_heap_start`  
Start of free memory, as defined by the linker

#### 18.31.5.2 malloc\_first

`pmmalloc_hunk malloc_first`  
First hunk

## 18.32.1 Detailed Description

Metasprite support

## 18.32.2 Macro Definition Documentation

### 18.32.2.1 metasprite\_end

```
#define metasprite_end -128
```

## 18.32.3 Typedef Documentation

### 18.32.3.1 metasprite\_t

```
typedef struct metasprite_t metasprite_t
```

metasprite item description

## 18.32.4 Function Documentation

### 18.32.4.1 move\_metasprite()

```
UBYTE move_metasprite (
 const metasprite_t * metasprite,
 UINT8 base_tile,
 UINT8 base_sprite,
 UINT8 x,
 UINT8 y) [inline]
```

Moves metasprite to the absolute position x and y, allocating hardware sprites from base\_sprite using tiles from base\_tile

#### Parameters

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <i>metasprite</i>  | metasprite description                           |
| <i>base_tile</i>   | start tile where tiles for that metasprite begin |
| <i>base_sprite</i> | start hardware sprite                            |
| <i>x</i>           | absolute x coordinate of the sprite              |
| <i>y</i>           | absolute y coordinate of the sprite              |

#### Returns

number of hardware sprites used to draw this metasprite

### 18.32.4.2 move\_metasprite\_vflip()

```
UBYTE move_metasprite_vflip (
 const metasprite_t * metasprite,
 UINT8 base_tile,
 UINT8 base_sprite,
 UINT8 x,
 UINT8 y) [inline]
```

#### 18.32.4.3 move metasprite\_hflip()

```
UBYTE move_metasprite_hflip (
 const metasprite_t * metasprite,
 UINT8 base_tile,
 UINT8 base_sprite,
 UINT8 x,
 UINT8 y) [inline]
```

#### 18.32.4.4 move\_metasprite\_hvflip()

```
UBYTE move_metasprite_hvflip (
 const metasprite_t * metasprite,
 UINT8 base_tile,
 UINT8 base_sprite,
 UINT8 x,
 UINT8 y) [inline]
```

#### 18.32.4.5 hide\_metasprite()

```
void hide_metasprite (
 const metasprite_t * metasprite,
 UINT8 base_sprite) [inline]
```

Hides metasprite from screen

##### Parameters

|                    |                        |
|--------------------|------------------------|
| <i>metasprite</i>  | metasprite description |
| <i>base_sprite</i> | start hardware sprite  |

### 18.32.5 Variable Documentation

#### 18.32.5.1 \_\_current\_metasprite

```
const void* __current_metasprite
```

#### 18.32.5.2 \_\_current\_base\_tile

```
UBYTE __current_base_tile
```

#### 18.32.5.3 \_\_render\_shadow\_OAM

```
UBYTE __render_shadow_OAM
```

## 18.33 gb/sample.h File Reference

### Functions

- void [play\\_sample](#) (UINT8 \*start, UINT16 len) NONBANKED

### 18.33.1 Detailed Description

Playback raw sound sample with length `len` from start at 8192Hz rate. `len` defines the length of the sample in samples/32 or bytes/16. The format of the data is unsigned 4-bit samples, 2 samples per byte, upper 4-bits played before lower 4 bits.

Adaption for GBDK by Lars Malmberg. Original code by Jeff Frohwein.

### 18.33.2 Function Documentation

#### 18.33.2.1 `play_sample()`

```
void play_sample (
 UINT8 * start,
 UINT16 len)
```

Play the given, appropriately formatted sample.

### 18.34.1 Detailed Description

Super Gameboy definitions.

See the example SGB project for additional details.

### 18.34.2 Macro Definition Documentation

#### 18.34.2.1 SGB\_PAL\_01

```
#define SGB_PAL_01 0x00U
```

SGB Command: Set SGB Palettes 0 & 1

#### 18.34.2.2 SGB\_PAL\_23

```
#define SGB_PAL_23 0x01U
```

SGB Command: Set SGB Palettes 2 & 3

#### 18.34.2.3 SGB\_PAL\_03

```
#define SGB_PAL_03 0x02U
```

SGB Command: Set SGB Palettes 0 & 3

#### 18.34.2.4 SGB\_PAL\_12

```
#define SGB_PAL_12 0x03U
```

SGB Command: Set SGB Palettes 1 & 2

#### 18.34.2.5 SGB\_ATTR\_BLK

```
#define SGB_ATTR_BLK 0x04U
```

SGB Command: Set color attributes for rectangular regions

#### 18.34.2.6 SGB\_ATTR\_LIN

```
#define SGB_ATTR_LIN 0x05U
```

SGB Command: Set color attributes for horizontal or vertical character lines

#### 18.34.2.7 SGB\_ATTR\_DIV

```
#define SGB_ATTR_DIV 0x06U
```

SGB Command: Split screen in half and assign separate color attributes to each side and the divider

#### 18.34.2.8 SGB\_ATTR\_CHR

```
#define SGB_ATTR_CHR 0x07U
```

SGB Command: Set color attributes for separate charactersSet SGB Palette 0,1 Data

#### 18.34.2.9 SGB\_SOUND

```
#define SGB_SOUND 0x08U
```

SGB Command: Start and stop a internal sound effect, and sounds using internal tone data

#### 18.34.2.10 SGB\_SOU\_TRN

```
#define SGB_SOU_TRN 0x09U
```

SGB Command: Transfer sound code or data to the SNES APU RAM

**18.34.2.11 SGB\_PAL\_SET**

```
#define SGB_PAL_SET 0x0AU
```

SGB Command: Apply (previously transferred) SGB system color palettes to actual SNES palettes

**18.34.2.12 SGB\_PAL\_TRN**

```
#define SGB_PAL_TRN 0x0BU
```

SGB Command: Transfer palette data into SGB system color palettes

**18.34.2.13 SGB\_ATRC\_EN**

```
#define SGB_ATRC_EN 0x0CU
```

SGB Command: Enable/disable Attraction mode. It is enabled by default

**18.34.2.14 SGB\_TEST\_EN**

```
#define SGB_TEST_EN 0x0DU
```

SGB Command: Enable/disable test mode for "SGB-CPU variable clock speed function"

**18.34.2.15 SGB\_ICON\_EN**

```
#define SGB_ICON_EN 0x0EU
```

SGB Command: Enable/disable ICON functionality

**18.34.2.16 SGB\_DATA\_SND**

```
#define SGB_DATA_SND 0x0FU
```

SGB Command: Write one or more bytes into SNES Work RAM

**18.34.2.17 SGB\_DATA\_TRN**

```
#define SGB_DATA_TRN 0x10U
```

SGB Command: Transfer code or data into SNES RAM

**18.34.2.18 SGB\_MLT\_REQ**

```
#define SGB_MLT_REQ 0x11U
```

SGB Command: Request multiplayer mode (input from more than one joystick)

**18.34.2.19 SGB\_JUMP**

```
#define SGB_JUMP 0x12U
```

SGB Command: Set the SNES program counter and NMI (vblank interrupt) handler to specific addresses

**18.34.2.20 SGB\_CHR\_TRN**

```
#define SGB_CHR_TRN 0x13U
```

SGB Command: Transfer tile data (characters) to SNES Tile memory

**18.34.2.21 SGB\_PCT\_TRN**

```
#define SGB_PCT_TRN 0x14U
```

SGB Command: Transfer tile map and palette data to SNES BG Map memory

**18.34.2.22 SGB\_ATTR\_TRN**

```
#define SGB_ATTR_TRN 0x15U
```

SGB Command: Transfer data to (color) Attribute Files (ATFs) in SNES RAM

### 18.34.2.23 SGB\_ATTR\_SET

```
#define SGB_ATTR_SET 0x16U
```

SGB Command: Transfer attributes from (color) Attribute Files (ATF) to the Game Boy window

### 18.34.2.24 SGB\_MASK\_EN

```
#define SGB_MASK_EN 0x17U
```

SGB Command: Modify Game Boy window mask settings

### 18.34.2.25 SGB\_OBJ\_TRN

```
#define SGB_OBJ_TRN 0x18U
```

SGB Command: Transfer OBJ attributes to SNES OAM memory

## 18.34.3 Function Documentation

### 18.34.3.1 sgb\_check()

```
UINT8 sgb_check (
 void)
```

Returns a non-null value if running on Super GameBoy

### 18.34.3.2 sgb\_transfer()

```
void sgb_transfer (
 unsigned char * packet)
```

Transfer a SGB packet

#### Parameters

|               |                                         |
|---------------|-----------------------------------------|
| <i>packet</i> | Pointer to buffer with SGB packet data. |
|---------------|-----------------------------------------|

The first byte of **packet** should be a SGB command, then up to 15 bytes of command parameter data. See the `sgb_border` GBDK example project for a demo of how to use these the sgb functions.

See also

[sgb\\_check\(\)](#)

### 18.34.3.3 sgb\_transfer\_nowait()

```
void sgb_transfer_nowait (
 unsigned char * packet)
```

Transfer a SGB packet without the 60 ms / 4 frame delay at the end (the delay time is required between consecutive SGB packets)

#### Parameters

|               |                                         |
|---------------|-----------------------------------------|
| <i>packet</i> | Pointer to buffer with SGB packet data. |
|---------------|-----------------------------------------|

### Functions

- void [initrand](#) ([UINT16](#) seed) [NONBANKED](#)
- [INT8](#) [rand](#) (void)
- [UINT16](#) [randw](#) (void)
- void [initarand](#) ([UINT16](#) seed)
- [INT8](#) [arand](#) (void)

### 18.37.1 Detailed Description

Random generator using the linear congruential method

#### Author

Luc Van den Borre

### 18.37.2 Function Documentation

#### 18.37.2.1 initrand()

```
void initrand (
 UINT16 seed)
```

Initialise the pseudo-random number generator.

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>seed</i> | The value for initializing the random number generator. |
|-------------|---------------------------------------------------------|

The seed should be different each time, otherwise the same pseudo-random sequence will be generated.

The DIV Register ([DIV\\_REG](#)) is sometimes used as a seed, particularly if read at some variable point in time (such as when the player presses a button).

Only needs to be called once to initialize, but may be called again to re-initialize with the same or a different seed.

#### See also

[rand\(\)](#), [randw\(\)](#)

### 18.37.2.2 rand()

```
INT8 rand (
 void)
```

Returns a random byte (8 bit) value.

[initrand\(\)](#) should be used to initialize the random number generator before using [rand\(\)](#)

### 18.37.2.3 randw()

```
UINT16 randw (
 void)
```

Returns a random word (16 bit) value.

[initrand\(\)](#) should be used to initialize the random number generator before using [rand\(\)](#)

### 18.37.2.4 initrand()

```
void initrand (
 UINT16 seed)
```

Random generator using the linear lagged additive method

#### Parameters

|             |                                                         |
|-------------|---------------------------------------------------------|
| <i>seed</i> | The value for initializing the random number generator. |
|-------------|---------------------------------------------------------|

Note: [initrand\(\)](#) calls [initrand\(\)](#) with the same seed value, and uses [rand\(\)](#) to initialize the random generator.

See also

[initrand\(\)](#) for suggestions about seed values, [arand\(\)](#)

### 18.37.2.5 arand()

```
INT8 arand (
 void)
```

Returns a random number generated with the linear lagged additive method.

[initrand\(\)](#) should be used to initialize the random number generator before using [arand\(\)](#)

**18.42.2.15 int\_fast32\_t**

```
typedef long int int_fast32_t
```

**18.42.2.16 uint\_fast8\_t**

```
typedef unsigned char uint_fast8_t
```

**18.42.2.17 uint\_fast16\_t**

```
typedef unsigned int uint_fast16_t
```

**18.42.2.18 uint\_fast32\_t**

```
typedef unsigned long int uint_fast32_t
```

**18.42.2.19 intptr\_t**

```
typedef int intptr_t
```

**18.42.2.20 uintptr\_t**

```
typedef unsigned int uintptr_t
```

**18.42.2.21 intmax\_t**

```
typedef long int intmax_t
```

**18.42.2.22 uintmax\_t**

```
typedef unsigned long int uintmax_t
```

## 18.43 stdio.h File Reference

```
#include <types.h>
```

### Functions

- void [putchar](#) (char c)
- void [printf](#) (const char \*format,...) **NONBANKED**
- void [sprintf](#) (char \*str, const char \*format,...) **NONBANKED**
- void [puts](#) (const char \*s) **NONBANKED**
- char \* [gets](#) (char \*s)
- char [getchar](#) (void)

### 18.43.1 Detailed Description

Basic file/console input output functions.

Including `stdio.h` will use a large number of the background tiles for font characters. If `stdio.h` is not included then that space will be available for use with other tiles instead.

### 18.43.2 Function Documentation

#### 18.43.2.1 `putchar()`

```
void putchar (
 char c)
```

Write the character **c** to stdout.

#### 18.43.2.2 `printf()`

```
void printf (
 const char * format,
 ...)
```

Print the string and arguments given by format to stdout.

##### Parameters

|               |                                              |
|---------------|----------------------------------------------|
| <i>format</i> | The format string as per <code>printf</code> |
|---------------|----------------------------------------------|

Does not return the number of characters printed.

Currently supported:

- `%hx` (char as hex)
- `%hu` (unsigned char)
- `%hd` (signed char)
- `%c` (character)
- `%u` (unsigned int)
- `%d` (signed int)
- `%x` (unsigned int as hex)
- `%s` (string)

Warning: to correctly pass chars for printing as chars, they *must* be explicitly re-cast as such when calling the function. See [docs\\_chars\\_varargs](#) for more details.

#### 18.43.2.3 `sprintf()`

```
void sprintf (
 char * str,
 const char * format,
 ...)
```

Print the string and arguments given by format to a buffer.

##### Parameters

|               |                                                 |
|---------------|-------------------------------------------------|
| <i>str</i>    | The buffer to print into                        |
| <i>format</i> | The format string as per <a href="#">printf</a> |

Does not return the number of characters printed.

#### 18.43.2.4 puts()

```
void puts (
 const char * s)
```

[puts\(\)](#) writes the string **s** and a trailing newline to stdout.

#### 18.43.2.5 gets()

```
char* gets (
 char * s)
```

[gets\(\)](#) Reads a line from stdin into a buffer pointed to by **s**.

##### Parameters

|          |                           |
|----------|---------------------------|
| <b>s</b> | Buffer to store string in |
|----------|---------------------------|

Reads until either a terminating newline or an EOF, which it replaces with '\0'. No check for buffer overrun is performed.

Returns: Buffer pointed to by **s**

#### 18.43.2.6 getchar()

```
char getchar (
 void)
```

[getchar\(\)](#) Reads and returns a single character from stdin.

## 18.44 stdlib.h File Reference

```
#include <types.h>
```

### Macros

- [#define \\_\\_reentrant](#)

### Functions

- void [exit](#) (int status) [NONBANKED](#)
- int [abs](#) (int i)
- long [labs](#) (long num)
- int [atoi](#) (const char \*s)
- long [atol](#) (const char \*s)
- char \* [itoa](#) (int n, char \*s)
- char \* [utoa](#) (unsigned int n, char \*s)
- char \* [ltoa](#) (long n, char \*s)
- char \* [ultoa](#) (unsigned long n, char \*s)
- void \* [calloc](#) ([size\\_t](#) nmemb, [size\\_t](#) size)

- void \* [realloc](#) (void \*ptr, [size\\_t](#) size)
- void [free](#) (void \*ptr)
- void \* [bsearch](#) (const void \*key, const void \*base, [size\\_t](#) nmemb, [size\\_t](#) size, int(\*compar)(const void \*, const void \*) [\\_\\_reentrant](#))
- void [qsort](#) (void \*base, [size\\_t](#) nmemb, [size\\_t](#) size, int(\*compar)(const void \*, const void \*) [\\_\\_reentrant](#))

## 18.44.1 Macro Definition Documentation

### 18.44.1.1 `__reentrant`

```
#define __reentrant
```

file `stdlib.h` 'Standard library' functions, for whatever that means.

## 18.44.2 Function Documentation

### 18.44.2.1 `exit()`

```
void exit (
 int status)
```

Causes normal program termination and the value of `status` is returned to the parent. All open streams are flushed and closed.

### 18.44.2.2 `abs()`

```
int abs (
 int i)
```

Returns the absolute value of `int i`

#### Parameters

|                |                                 |
|----------------|---------------------------------|
| <code>i</code> | Int to obtain absolute value of |
|----------------|---------------------------------|

If `i` is negative, returns `-i`; else returns `i`.

### 18.44.2.3 `labs()`

```
long labs (
 long num)
```

Returns the absolute value of long int **num**

#### Parameters

|                  |                                          |
|------------------|------------------------------------------|
| <code>num</code> | Long integer to obtain absolute value of |
|------------------|------------------------------------------|

### 18.44.2.4 `atoi()`

```
int atoi (
 const char * s)
```

Converts an ASCII string to an int

#### Parameters

|                |                             |
|----------------|-----------------------------|
| <code>s</code> | String to convert to an int |
|----------------|-----------------------------|

The string may be of the format

```
[\s]*[+-][\d]+[\D]*
```

i.e. any number of spaces, an optional `+` or `-`, then an arbitrary number of digits.

The result is undefined if the number doesn't fit in an int.

Returns: Int value of string

### 18.44.2.5 atol()

```
long atol (
 const char * s)
```

Converts an ASCII string to a long.

#### Parameters

|          |                                  |
|----------|----------------------------------|
| <i>s</i> | String to convert to an long int |
|----------|----------------------------------|

#### See also

[atoi\(\)](#)

Returns: Long int value of string

### 18.44.2.6 itoa()

```
char* itoa (
 int n,
 char * s)
```

Converts an int into a base 10 ASCII string.

#### Parameters

|          |                                      |
|----------|--------------------------------------|
| <i>n</i> | Int to convert to a string           |
| <i>s</i> | String to store the converted number |

Returns: Pointer to converted string

### 18.44.2.7 utoa()

```
char* utoa (
 unsigned int n,
 char * s)
```

Converts an unsigned int into a base 10 ASCII string.

#### Parameters

|          |                                      |
|----------|--------------------------------------|
| <i>n</i> | Unsigned Int to convert to a string  |
| <i>s</i> | String to store the converted number |

Returns: Pointer to converted string

### 18.44.2.8 ltoa()

```
char* ltoa (
 long n,
 char * s)
```

Converts a long into a base 10 ASCII string.

#### Parameters

|          |                                      |
|----------|--------------------------------------|
| <i>n</i> | Long int to convert to a string      |
| <i>s</i> | String to store the converted number |

Returns: Pointer to converted string

**18.44.2.9 ultoa()**

```
char* ultoa (
 unsigned long n,
 char * s)
```

Converts an unsigned long into a base 10 ASCII string.

**Parameters**

|          |                                          |
|----------|------------------------------------------|
| <i>n</i> | Unsigned Long Int to convert to a string |
| <i>s</i> | String to store the converted number     |

Returns: Pointer to converted string

**18.44.2.10 calloc()**

```
void* calloc (
 size_t nmemb,
 size_t size)
```

Memory allocation functions

**18.44.2.11 malloc()**

```
void* malloc (
 size_t size)
```

**18.44.2.12 realloc()**

```
void* realloc (
 void * ptr,
 size_t size)
```

**18.44.2.13 free()**

```
void free (
 void * ptr)
```

**18.44.2.14 bsearch()**

```
void* bsearch (
 const void * key,
 const void * base,
 size_t nmemb,
 size_t size,
 int (*)(const void *, const void *) __reentrant compar)
```

search a sorted array of **nmemb** items

**Parameters**

|               |                                                    |
|---------------|----------------------------------------------------|
| <i>key</i>    | Pointer to object that is the key for the search   |
| <i>base</i>   | Pointer to first object in the array to search     |
| <i>nmemb</i>  | Number of elements in the array                    |
| <i>size</i>   | Size in bytes of each element in the array         |
| <i>compar</i> | Function used to compare two elements of the array |

Returns: Pointer to array entry that matches the search key. If key is not found, NULL is returned.

#### 18.44.2.15 qsort()

```
void qsort (
 void * base,
 size_t nmemb,
 size_t size,
 int (*)(const void *, const void *) __reentrant compar)
```

Sort an array of **nmemb** items

##### Parameters

|               |                                                             |
|---------------|-------------------------------------------------------------|
| <i>base</i>   | Pointer to first object in the array to sort                |
| <i>nmemb</i>  | Number of elements in the array                             |
| <i>size</i>   | Size in bytes of each element in the array                  |
| <i>compar</i> | Function used to compare and sort two elements of the array |

### Variables

- char `c`

### 18.46.1 Detailed Description

Generic string functions.

### 18.46.2 Function Documentation

#### 18.46.2.1 strcpy()

```
char* strcpy (
 char * dest,
 const char * src)
```

Copies the string pointed to by **src** (including the terminating '0' character) to the array pointed to by **dest**. The strings may not overlap, and the destination string *dest* must be large enough to receive the copy.

##### Parameters

|             |                    |
|-------------|--------------------|
| <i>dest</i> | Array to copy into |
| <i>src</i>  | Array to copy from |

##### Returns

A pointer to *dest*

#### 18.46.2.2 strcmp()

```
int strcmp (
 const char * s1,
 const char * s2)
```

Compares strings

##### Parameters

|           |                          |
|-----------|--------------------------|
| <i>s1</i> | First string to compare  |
| <i>s2</i> | Second string to compare |

##### Returns:

- $> 0$  if **s1**  $>$  **s2**
- $0$  if **s1**  $==$  **s2**
- $< 0$  if **s1**  $<$  **s2**

#### 18.46.2.3 memcpy()

```
void* memcpy (
 void * dest,
 const void * src,
 size_t len)
```

Copies *n* bytes from memory area *src* to memory area *dest*. The memory areas may not overlap.

## Parameters

|             |                         |
|-------------|-------------------------|
| <i>dest</i> | Buffer to copy into     |
| <i>src</i>  | Buffer to copy from     |
| <i>len</i>  | Number of Bytes to copy |

**18.46.2.4 memmove()**

```
void* memmove (
 void * dest,
 const void * src,
 size_t n)
```

Copies *n* bytes from memory area *src* to memory area *dest*, areas may overlap

**18.46.2.5 memset()**

```
void* memset (
 void * s,
 int c,
 size_t n)
```

Fills the memory region *s* with *n* bytes using value *c*

## Parameters

|          |                                              |
|----------|----------------------------------------------|
| <i>s</i> | Buffer to fill                               |
| <i>c</i> | char value to fill with (truncated from int) |
| <i>n</i> | Number of bytes to fill                      |

**18.46.2.6 reverse()**

```
char* reverse (
 char * s)
```

Reverses the characters in a string

## Parameters

|          |                               |
|----------|-------------------------------|
| <i>s</i> | Pointer to string to reverse. |
|----------|-------------------------------|

For example 'abcdefg' will become 'gfedcba'.

Banked as the string must be modifiable.

Returns: Pointer to *s*

**18.46.2.7 strcat()**

```
char* strcat (
 char * s1,
 const char * s2)
```

Concatenate Strings. Appends string *s2* to the end of string *s1*

## Parameters

|           |                       |
|-----------|-----------------------|
| <i>s1</i> | String to append onto |
| <i>s2</i> | String to copy from   |

For example 'abc' and 'def' will become 'abcdef'.  
String **s1** must be large enough to store both **s1** and **s2**.  
Returns: Pointer to **s1**

#### 18.46.2.8 strlen()

```
int strlen (
 const char * s)
```

Calculates the length of a string

##### Parameters

|          |                               |
|----------|-------------------------------|
| <i>s</i> | String to calculate length of |
|----------|-------------------------------|

Returns: Length of string not including the terminating '\0' character.

#### 18.46.2.9 strncat()

```
char* strncat (
 char * s1,
 const char * s2,
 int n)
```

Concatenate at most **n** characters from string **s2** onto the end of **s1**.

##### Parameters

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>s1</i> | String to append onto                           |
| <i>s2</i> | String to copy from                             |
| <i>n</i>  | Max number of characters to copy from <b>s2</b> |

String **s1** must be large enough to store both **s1** and **n** characters of **s2**  
Returns: Pointer to **s1**

#### 18.46.2.10 strncmp()

```
int strncmp (
 const char * s1,
 const char * s2,
 int n)
```

Compare strings (at most **n** characters):

##### Parameters

|           |                                     |
|-----------|-------------------------------------|
| <i>s1</i> | First string to compare             |
| <i>s2</i> | Second string to compare            |
| <i>n</i>  | Max number of characters to compare |

Returns:

- $> 0$  if **s1**  $>$  **s2**
- $0$  if **s1**  $==$  **s2**
- $< 0$  if **s1**  $<$  **s2**

### 18.46.2.11 strncpy()

```
char* strncpy (
 char * s1,
 const char * s2,
 int n)
```

Copy **n** characters from string **s2** to **s1**

#### Parameters

|           |                                                 |
|-----------|-------------------------------------------------|
| <i>s1</i> | String to copy into                             |
| <i>s2</i> | String to copy from                             |
| <i>n</i>  | Max number of characters to copy from <b>s2</b> |

If **s2** is shorter than **n**, the remaining bytes in **s1** are filled with `\0`.

Warning: If there is no `\0` in the first **n** bytes of **s2** then **s1** will not be null terminated.

Returns: Pointer to **s1**

## 18.46.3 Variable Documentation

### 18.46.3.1 c

```
int c
```

## 18.47 time.h File Reference

```
#include <types.h>
```

### Macros

- `#define CLOCKS_PER_SEC 60`

### Typedefs

- `typedef UINT16 time_t`

### Functions

- `clock_t clock (void) NONBANKED`
- `time_t time (time_t *t)`

### 18.47.1 Detailed Description

Sort of ANSI compliant time functions.

### 18.47.2 Macro Definition Documentation

#### 18.47.2.1 CLOCKS\_PER\_SEC

```
#define CLOCKS_PER_SEC 60
```

### 18.47.3 Typedef Documentation

#### 18.47.3.1 time\_t

```
typedef UINT16 time_t
```

### 18.47.4 Function Documentation

#### 18.47.4.1 clock()

```
clock_t clock (
 void)
```

Returns an approximation of processor time used by the program in Clocks

The value returned is the CPU time (ticks) used so far as a [clock\\_t](#).

To get the number of seconds used, divide by [CLOCKS\\_PER\\_SEC](#).

This is based on [sys\\_time](#), which will wrap around every ~18 minutes. (unsigned 16 bits = 65535 / 60 / 60 = 18.2)

See also

[sys\\_time](#), [time\(\)](#)

#### 18.47.4.2 time()

```
time_t time (
 time_t * t)
```

Converts [clock\(\)](#) time to Seconds

##### Parameters

|          |                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------|
| <i>t</i> | If pointer <i>t</i> is not NULL, it's value will be set to the same seconds calculation as returned by the function. |
|----------|----------------------------------------------------------------------------------------------------------------------|

The calculation is [clock\(\)](#) / CLOCKS\_PER\_SEC

Returns: time in seconds
